## Eurovent

Within Europe, a wide variety of published data on capacities are in use, generally depending on national standards. Most in use by the leading manufacturers are national and international standards like DIN, ENV, NEN-EN and ASHRAE. Due to this, customers have not been able to make objective product comparisons, since data published on capacities were based on DT<sub>1</sub>, DTM, dry or wet conditions, with or without certification, etc.

To meet the European requirements on EN standards, the European Refrigeration Industry embodied by Eurovent has set standards to guarantee an independent certification procedure for forced convection air cooled condensers based on NEN-EN 327 and unit air coolers based on NEN-EN 328. Being an active member of Eurovent, the capacities of the Helpman commercial cooler programme, as given in the technical documentation, are based on NEN-EN 328 (evaporating temperature  $t_0 = -8\text{ }^\circ\text{C}$ , 8 K temperature difference between air-on temperature and evaporating temperature (DT<sub>1</sub>)).

In order to enable air cooler selection for operating conditions, technical documentation should also give capacities for humid/frosted conditions. According to Eurovent these 'frosted conditions' are to be calculated by multiplying 'dry capacities' with a factor 1.15. These data can be found in the capacity tables, in the columns marked "frosted".

## Model indication

Pos.	Reference	Options
1	Cooler type	14-24
2	Fin spacing	7 mm
3	Fan type	H (n = 1500 rpm) L1 (n = 1000 rpm) L2 (n = 500 rpm)
4	Current	400 = 230/400/50/3 230 = 230/50/1
5	Options	For a full survey of all available options see page 4.

## Capacities

### Frosted conditions

- Lightly frosted coil.
- Relative humidity 85 %.
- Suction gas superheating 62% of the temperature difference (DT<sub>1</sub>), with a minimum of 3.5 K.
- Refrigerant liquid temperature 30 °C (for t<sub>0</sub> = -20 °C and below: liquid temperature 10 °C).

### Evaporating temperature t<sub>0</sub>

Evaporating temperature t<sub>0</sub> is the saturated temperature according to the pressure at the suction outlet of the cooler.

### Dry conditions

Cooling capacity where no condensation or ice build-up occurs on the coil (100% sensible cooling). This condition is used by Eurovent to standardise capacity ratings but should not be used when selecting coolers.

For cooler selection use the columns marked "frosted".

## Defrost Systems

Two forced defrost designs are available for LDX coolers : hot gas defrost and electric defrost. Each defrost system is optimised for specific applications and ambient conditions.

### Electric defrost (E2)

Stainless steel heater elements placed in additional tubes between the evaporator tubes. The elements for the driptray are fitted to the bottom of the inner tray.

Both coil and driptray have the same elements. Standard voltage per element 230 V.

Connection to 230 V / 1 phase or 400 V / 3 phase, connected in star with Zero-Wire. Total defrost power is given for 400 V / 3 phase with Zero-Wire.

The elements can be withdrawn at the refrigerant connection side. The driptray elements can be taken out after removal of the outer tray. The heater elements are pre-wired and are connected to one or more terminal boxes.

The following electric defrost system is available for LDX coolers:

**E2**      *Air on temperature down to - 25 °C.*  
Electric stainless steel defrost elements in coil block and driptray.

## Defrost power

### Electrical defrost E2

Cooler-model	number of elements		defrost power kW	
	coil block	driptray	standard	reduced
LDX 14	2 x 2	2 x 1	5.6	4.2
LDX 17	2 x 2	2 x 1	5.6	4.2
LDX 19	2 x 2	2 x 1	11.1	8.3
LDX 22	2 x 2	2 x 1	11.1	8.3
LDX 24	2 x 2	2 x 1	11.1	8.3

### Hot Gas Defrost G1 (on request only)

The driptray can be fitted with a copper defrost coil to bring it rapidly up to temperature by means of hot gas. This system may be applied to air on temperatures down to -5 °C.

## Fans

Fans mounted in vibration dampers and fitted with balanced aluminium fan blades. Fan guards electrolytically galvanized and epoxy coated according to DIN 31001.

Enclosed design spray-tight motors, protection class IP-55. Motor windings suitable for 230 Volt.

All motors are equipped with a thermal safety device built in the windings, connected to separate terminals in the box.

This safety device can therefore be integrated into the control circuit. The electrical control should be arranged preferably with a manual reset device in order to prevent continuous on/off switching (tripping) of the motors.

### Thermal safety device values (A)

Fan motor	LDX type	Temperature °C			
		+10	0	-20	-40
<b>230 / 50 / 1</b>					
220 W	H	2.5	2.6	2.8	2.9
180 W	L1	2.3	2.4	2.6	2.7
35 W	L2	0.6	0.6	0.7	0.7
<b>230 / 400 / 50 / 3</b>					
250 W	H	1.1	1.2	1.3	1.3
250 W	L1	1.1	1.2	1.3	1.3
35 W	L2	0.4	0.4	0.5	0.5

## Air throw

The throws as given in the tables are for veiling mounted coolers at t = 20 °C, an unrestrained air flow in the cold room and a minimal air velocity of 0.25 m/s at air throw distance.

## Sound pressure dB(A)

Sound pressure as given in the tables are sound pressure levels in dB(A) at 5 m distance in free field conditions. Values may deviate depending on situations at site. The table below gives calculated sound pressure corrections at various distances.

Distance m	Correction dB(A)
1	+ 14
2	+ 8
3	+ 4
4	+ 2
5	0
10	- 6
20	-12
50	-20

## Selection Example DT<sub>1</sub>

Refrigerant .....	R-404A dx
Required cooling capacity .....	7.4 kW
Fan speed .....	1000 rpm
Air-on temperature .....	-16 °C
Evaporating temperature .....	-25 °C

1)  $DT_1 = -16 - (-25) = 9 \text{ K}$

2) Correction factor  $DT_1/R-404A : 1.06$

3) Multiply required capacity  
with correction factor:  $7.4 \times 1.06 = 7.8 \text{ kW}$ .

4) Cooler models can be selected in the column "capacity/  
frosted" on page 7 with a nominal capacity of 7.8 kW.

For the above mentioned conditions the following models can  
be selected:

- LDX 17-7-L1, nom. cap. 7.1 kW.
- LDX 19-7-L1, nom. cap. 8.5 kW.

Depending on parameters such as *air flow*, *number of fans*  
and *dimensions* (see tables) a final cooler model selection  
can take place.

Capacity values under "dry conditions" are reference values  
for Eurovent conditions.

Standard- condition SC	Air on temp. °C	Evaporating temperature °C	Factor dry/ frosted
SC1	10	0	1.35
SC2	0	-8	1.15
SC3	-18	-25	1.05
SC4	-25	-31	1.00

SC 2 : Nominal capacity for cooling design.

Air-on temperature is the air temperature at the intake side of  
the coil block.
