

Polacel cooling towers CM Series Counterflow

General information on the CM cooling towers

Operating principle

The Polacel cooling tower CM operates according to the counterflow principle. The water to be cooled is fed into the tower at the top and is distributed by full cone nozzles with low pressure drop, in the form of a thin waterfilm and small droplets, over the largest possible fill surface for the heat transfer.

The water falls through the fill and is collected again in a reservoir at the bottom of the tower. The outside air is sucked in through the louvres of the tower and is forced in counterflow through the fill. The circulating water is cooled by transferring heat to the passing air by evaporation and direct contact.

Selection of materials

Polacel has based the selection of materials for the CM cooling towers on the requirement that they must be completely resistant to corrosion and chemicals. This has been achieved through the exclusive use of PVC, polypropylene, fibreglass reinforced polyester (FRP) and stainless steel (304 SS) for the internals and hot dipped galvanized steel for the externals.

Material specifications:

- Hot pressed FRP panels for the casing, colour grey RAL 7035.
- 304 SS corner support and internal profiles.
- Basin, fan deck, fan stack of FRP.
- Munters fill material of PVC (max. temp. 55°C).
- 304 SS bolts.
- High efficient axial fans of polypropylene (PP) or FRP.
- Munters drift eliminators of PVC (drift percentage shall not exceed 0,05% of circulating waterflow).
- Water distribution system with PVC pipe and PP nozzles.
- Air inlet louvres of hot pressed FRP, colour black.
- Foundation beams of hot dipped galvanized steel.

Why Polacel CM cooling towers?

- Energy efficient, use of high efficient fill, and nozzles with a low pressure drop.
- Durable, use of high quality materials.
- Guaranteed performance, use of Munters fill.
- Attractive looks, use of hot pressed FRP panels.

Polacel sizing and engineering data for CM cooling towers

NOTE: CM 1 to CM 16 direct drive
CM 20 to CM 81 right angle drive

NOTE: mentioned weights and dimensions of CM 36 to CM 81 are excluding water basin.

Selection tables for CM cooling towers

How to select a Polacel cooling tower type CM

Design conditions (example):

- circulating water quantity
Qw = 180 m³/hr
- water inlet temperature
Tw1 = 37°C
- water outlet temperature
Tw2 = 29°C
- Wet bulb temperature
Twb = 24°C

Determine range:
Tw1 - Tw2 = 8°C

Determine approach:
Tw2 - Twb = 5°C

Selection procedure:

The selection tables on the last page give 6 values for the specific waterflow R (m³/m².hr)

CM type	Fill height	
	60 cm	90 cm
DL	R = 13,0	R = 15,0
DM	R = 15,5	R = 17,7
DH	R = 18,4	R = 21,0

To determine the necessary tower surface, divide the circulating water flow by the specific water flow (in the above table).

Select a cooling tower model from the tables on this page, taking into account the fact that the wet surface in the table (first column) is greater than or equal to the necessary tower surface.

Cooling tower type	Necessary tower surface (m ²)	Selected cooling tower model
DL-60	13,8	CM 25 - DL-60
DM-60	11,6	CM 20 - DM-60
DH-60	9,8	CM 16 - DH-60
DL-90	12,0	CM 20 - DL-90
DM-90	10,2	CM 16 - DM-90
DH-90	8,6	CM 16 - DH-90

Cooling tower model	Wet surf (m ²)	Nominal capacity (kW)						Fan diam. (ft)	Fan power installed (kW)	Fan speed (Rpm)	SPL at 10m. dB (A)	Dimensions			Weight

are excluding water basin.

Selection tables for CM cooling towers

How to select a Polacel cooling tower type CM

Design conditions (example):

- circulating water quantity
Qw = 180 m³/hr
- water inlet temperature
Tw1 = 37°C
- water outlet temperature
Tw2 = 29°C
- Wet bulb temperature
Twb = 24°C

Determine range:
Tw1 - Tw2 = 8°C

Determine approach:
Tw2 - Twb = 5°C

Selection procedure:

The selection tables on the last page give 6 values for the specific waterflow R (m³/m².hr)

CM type	Fill height	
	60 cm	90 cm
DL	R = 13,0	R = 15,0
DM	R = 15,5	R = 17,7
DH	R = 18,4	R = 21,0

To determine the necessary tower surface, divide the circulating water flow by the specific water flow (in the above table).

Select a cooling tower model from the tables on this page, taking into account the fact that the wet surface in the table (first column) is greater than or equal to the necessary tower surface.

Cooling tower type	Necessary tower surface (m ²)	Selected cooling tower model
DL-60	13,8	CM 25 - DL-60
DM-60	11,6	CM 20 - DM-60
DH-60	9,8	CM 16 - DH-60
DL-90	12,0	CM 20 - DL-90
DM-90	10,2	CM 16 - DM-90
DH-90	8,6	CM 16 - DH-90

Nozzle selection

PRESSURE DROP NOZZLES

The above graph shows the specific waterflow versus the pressure drop for nozzle type B, C, D or E.

Selection example:

Which nozzle type to choose for a cooling tower model CM 25 - DL - 60 with a specific waterflow $R = 15 \text{ m}^3/\text{m}^2 \cdot \text{hr}$?

Nozzle type	B	C	D	E
Pressure drop (kPa)	—	90	47	10

CM 1 to CM 16 direct drive

CM 20 to CM 81 right angle drive

Standard options:

- frost protection waterpan
- two speed motors (1:2) (2:3)
- execution including waterpan or without
- vibration switches.

Non standard options:

- very low noise levels
- non clogging fill for poluted water
- multi cell units
- crossflow cooling towers
- stainless steel 316 SS
- CM 9 to CM 16 right angle drive
- any size not mentioned in this catalogue
- temperature resistance of fill and nozzles up to 90°C
- diffusers
- available performance curves at different air velocities and wet bulb temperatures
- ladders and railings

Selection tables for CM cooling towers
