

## Air-Cooled Liquid Chillers with Integrated Hydronic Module

**AQUASNAP™**  
with PURON® refrigerant

Quality Management System Approval

**Puron.**  
the environmentally sound refrigerant

Model shown is with  
low-noise option

## 30RB 162-802

**Nominal cooling capacity 163-760 kW**

The new generation of Aquasnap Puron liquid chillers features the latest technological innovations:

- ozone-friendly refrigerant R-410A
  - scroll compressors
  - low-noise fans made of a composite material
  - auto-adaptive microprocessor control
  - aluminium micro-channel heat exchangers (MCHX)
- The Aquasnap can be equipped with an integrated hydronic module, limiting the installation to straightforward operations like connection of the power supply and the chilled water supply and return piping.

### Features

#### Quiet operation

- Compressors
  - Low-noise scroll compressors with low vibration level
  - The compressor assembly is installed on an independent chassis and supported by flexible anti-vibration mountings
  - Dynamic suction and discharge piping support, minimising vibration transmission (Carrier patent)
  - Acoustic compressor enclosure, reducing radiated noise emissions (option)

#### ■ Condenser section

- Condenser coils in V-shape with an open angle, allowing quieter air flow across the coil
- Low-noise 4th generation Flying Bird fans, made of a composite material (Carrier patent) are now even quieter and do not generate intrusive low-frequency noise
- Rigid fan installation for reduced noise (Carrier patent)

#### Easy and fast installation

- Integrated hydronic module (option)
  - Centrifugal low or high-pressure water pump (as required), based on the pressure loss of the hydronic installation
  - Single or dual pump (as required) with operating time balancing and automatic changeover to the back-up pump if a fault develops
  - Water filter protecting the water pump against circulating debris
  - High-capacity membrane expansion tank ensures pressurisation of the water circuit
  - Thermal insulation and frost protection down to -20°C, using an electric resistance heater (see table of options)
  - Pressure gauge to check filter pollution and measure the system water flow rate
  - Water flow control valve

- Simplified electrical connections
  - A single power supply point without neutral (30RB 162-522)
  - Main disconnect switch with high trip capacity (see table of options)
  - 24 V control circuit without risk from a transformer included
- Fast commissioning
  - Systematic factory operation test before shipment
  - Quick-test function for step-by-step verification of the instruments, electrical components and motors

## Economical operation

- Increased energy efficiency at part load
  - The refrigerant circuit includes several compressors connected in parallel. At part load, around 99% of the operating time, only the compressors that are absolutely necessary operate. At these conditions the compressors operating are even more energy efficient, as they use the total condenser and evaporator capacity.
  - The electronic expansion device (EXV) allows operation at a lower condensing pressure (EER optimisation).
  - Dynamic superheat management for better utilisation of the evaporator heat exchange surface
  - All-aluminium micro-channel condenser (MCHX), more efficient than a copper/aluminium coil
- Reduced maintenance costs
  - Maintenance-free scroll compressors
  - Fast diagnosis of possible incidents and their history via the Pro-Dialog Plus control
  - R-410A refrigerant is easier to use than other refrigerant blends

## Environmental care

- Ozone-friendly R-410A refrigerant
  - Chlorine-free refrigerant of the HFC group with zero ozone depletion potential
  - High-density refrigerant, therefore less refrigerant required
  - Very efficient - gives an increased energy efficiency ratio (EER)
  - 40% reduction in the refrigerant charge through use of the micro-channel heat exchangers (MCHX)
- Leak-tight refrigerant circuit
  - Brazed refrigerant connections for increased leak-tightness
  - Reduction of leaks as no capillary tubes and flare connections are used
  - Verification of pressure transducers and temperature sensors without transferring refrigerant charge

## Superior reliability

- State-of-the-art concept
  - Cooperation with specialist laboratories and use of limit simulation tools (finite element calculations) for the design of the critical components, e.g. motor supports, suction/discharge piping
  - Compressor control box installed on the cold side of the compressor (Carrier patent)
  - All-aluminium micro-channel heat exchanger (MCHX) offers 3.5 times higher corrosion resistance than a conventional coil. The all-aluminium construction eliminates the formation of galvanic currents between aluminium and copper that are responsible for the coil corrosion in saline or corrosive atmospheres.
- Auto-adaptive control
  - Control algorithm prevents excessive compressor cycling and permits reduction of the water quantity in the hydronic circuit (Carrier patent).
  - Automatic compressor unloading in case of abnormally high condensing pressure. If an anomaly occurs (e.g. fouled condenser coil, fan failure) Aquasnap continues to operate, but at reduced capacity.
- Exceptional endurance tests
  - Corrosion resistance tests in salt mist in the laboratory
  - Accelerated ageing test on components that are submitted to continuous operation: compressor piping, fan supports
  - Transport simulation test in the laboratory on a vibrating table. The test is based on a military standard and equivalent to 4000 km by truck.

## Pro-Dialog Plus control

Pro-Dialog Plus combines intelligence with operating simplicity. The control constantly monitors all machine parameters and precisely manages the operation of compressors, expansion devices, fans and of the evaporator water pump for optimum energy efficiency.

- Energy management
  - Internal time schedule clock: permits chiller on/off control and operation at a second set point
  - Set point reset based on the outside air temperature or the return water temperature
  - Master/slave control of two chillers operating in parallel with operating time equalisation and automatic change-over in case of a unit fault.
  - Start/stop control based on the air temperature
- Ease-of-use
  - User interface with synoptic diagram for intuitive display of the principal operating parameters: number of compressors operating, suction/discharge pressure, compressor operating hours, set point, air temperature, entering/leaving water temperature
  - Ten menus for direct access to all machine commands, including fault history, allowing fast and complete chiller diagnostics

Pro-Dialog Plus operator interface

## Remote management (standard)

A simple two-wire communication bus between the RS485 port of the Aquasnap and the Carrier Comfort Network offers multiple remote control, monitoring and diagnostic possibilities. Carrier offers a vast choice of control products, specially designed to control, manage and supervise the operation of an air conditioning system. Please consult your Carrier representative for more information on these products.

- Start/stop: opening of this contact will shut down the unit
- Dual set point: closing of this contact activates a second set point (example: unoccupied mode)
- Demand limit: closing of this contact limits the maximum chiller capacity to a predefined value
- User safety: this contact is connected in series with the water flow switch and can be used for any customer safety loop
- Heat reclaim (option): closing of this contact allows heat reclaim mode operation
- Water pump 1 and 2 control\*: these outputs control the contactors of one or two evaporator water pumps
- Water pump on reversal\*: these contacts are used to detect a water pump operation fault and automatically change over to the other pump
- Operation indication: this volt-free contact indicates that the chiller is operating (cooling load) or that it is ready to operate (no cooling load)
- Alert indication: this volt-free contact indicates the presence of a minor fault
- Alarm indication: this volt-free contact indicates the presence of a major fault that has led to the shut-down of one or two refrigerant circuits

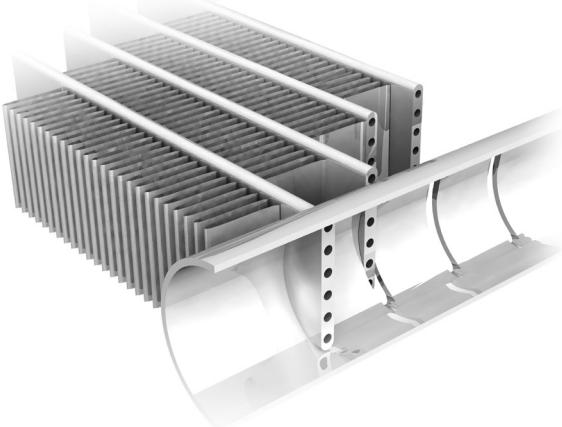

\* contacts already supplied with the hydronic module option

## Remote management (EMM option)

- Room temperature: permits set point reset based on the building indoor air temperature (with Carrier thermostat)
- Set point reset: ensures reset of the cooling set point based on a 4-20 mA or 0-5 V signal
- Demand limit: permits limitation of the maximum chiller demand based on a 4-20 mA or 0-5 V signal
- Demand limit 1 and 2: closing of these contacts limits the maximum chiller capacity to three predefined values
- User safety: this contact can be used for any customer safety loop, closing of the contact generates a specific alarm
- Ice storage end: when ice storage has finished, this input permits return to the second set point (unoccupied mode)
- Time schedule override: closing of this contact cancels the time schedule effects
- Out of service: this signal indicates that the chiller is completely out of service
- Chiller capacity: this analogue output (0-10 V) gives an immediate indication of the chiller capacity
- Compressor operation: this contact signals that one or several compressors are in operation

All aluminium micro-channel  
heat exchanger (MCHX)

Already utilised in the automobile and aeronautical industries for many years, the MCHX heat exchanger is entirely made of aluminium. This one-piece concept significantly increases its corrosion resistance by eliminating the galvanic currents that are created when two different metals (copper and aluminium) come into contact in traditional heat exchangers. Unlike traditional heat exchangers the MCHX heat exchanger can be used in moderate marine and urban environments.

From an energy efficiency point-of-view the MCHX heat exchanger is approximately 10% more efficient than a traditional coil and allows a 40% reduction in the amount of refrigerant used in the chiller. The low thickness of the MCHX reduces air pressure losses by 50% and makes it less susceptible to fouling (e.g. by sand) than a traditional coil. Cleaning of the MCHX heat exchanger is very fast using a high-pressure washer.

# Part load performances

With the rapid increase in energy costs and the care about environmental impacts of electricity production, the power consumption of air conditioning equipment has become an important topic. The energy efficiency of a liquid chiller at full load is rarely representative of the actual performance of the units, as on average a chiller works less than 5% of the time at full load.

The heat load of a building depends on many factors, such as the outside air temperature, the exposure to the sun and its occupation.

Consequently it is preferable to use the seasonal energy efficiency, calculated at several operating points that are representative for the unit utilisation.

## ESEER (EUROVENT)

The ESEER (European seasonal energy efficiency ratio) permits evaluation of the average energy efficiency at part load, based on four operating conditions defined by Eurovent. The ESEER is the average value of energy efficiency ratios (EER) at different operating conditions, weighted by the operating time.

## ESEER (European seasonal energy efficiency ratio)

Load, %	Air temperature, °C	Energy efficiency	Operating time, %
100	35	EER1	3
75	30	EER2	33
50	25	EER3	41
25	20	EER4	23

$$\text{ESEER} = \text{EER}_1 \times 3\% + \text{EER}_2 \times 33\% + \text{EER}_3 \times 41\% + \text{EER}_4 \times 23\%$$

Note: Constant leaving water temperature = 7°C

## Part load performances in accordance with Eurovent

\* Power input of the compressor(s) + fan(s) at maximum unit operating conditions. Values given on the unit name plate.

\*\* Nominal unit current draw at nominal conditions: evaporator entering/leaving water temperature 12°C/7°C, outdoor air temperature 35°C. The current values are given at 400 V nominal voltage.

\*\*\* Maximum unit operating current at maximum unit power input and 400 V.

† Maximum instantaneous starting current at 400 V nominal voltage and operating limit values with compressor in across-the-line start (maximum operating current of the smallest compressor(s) + fan current + locked rotor current of the largest compressor).

†† Standard for 30RB 162 to 262 and option for 30RB 302 to 802

‡ Not available for 30RB 162 to 262 and option for 30RB 302 to 802

**Note:** Units 30RB 602-802 have two electrical connection points.

# Operating limits

## Evaporator water flow rate

30RB 162-262 "B" standard units (with plate heat exchanger)

30RB	Minimum flow rate, l/s	Maximum flow rate, l/s*
162	2.8	13.9
182	2.8	13.9
202	2.8	14.3
232	3.0	14.3
262	3.5	14.3

30RB 162-262 "B" with option 280 (shell-and-tube heat exchanger) and 30RB 302-802

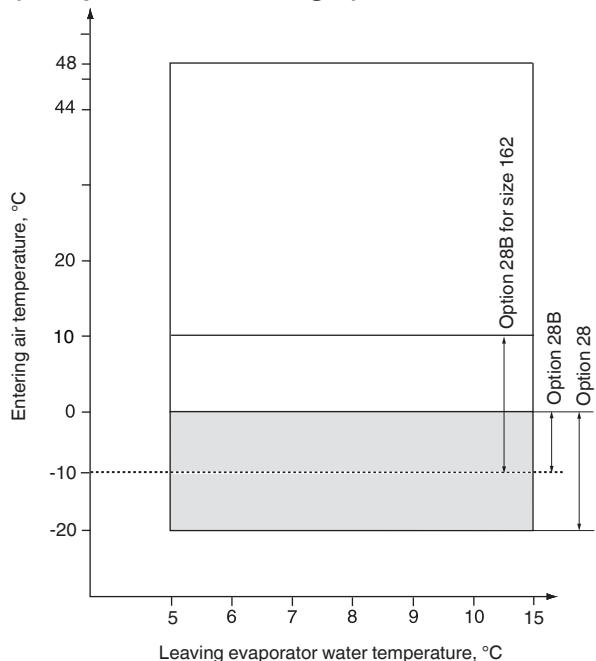

30RB	Minimum flow rate, l/s	Maximum flow rate, l/s*
162	2.8	28.1
182	2.8	28.1
202	2.8	28.1
232	3.0	26.7
262	3.5	26.7
302	3.9	26.7
342	4.4	29.4
372	4.9	29.4
402	5.2	29.4
432	5.8	31.1
462	6.1	31.1
522	6.9	31.1
602	7.9	50.6
672	8.7	50.6
732	9.6	50.6
802	10.3	50.6

\* The maximum flow rate corresponds to a pressure loss of 100 kPa (heat exchanger without hydronic module).

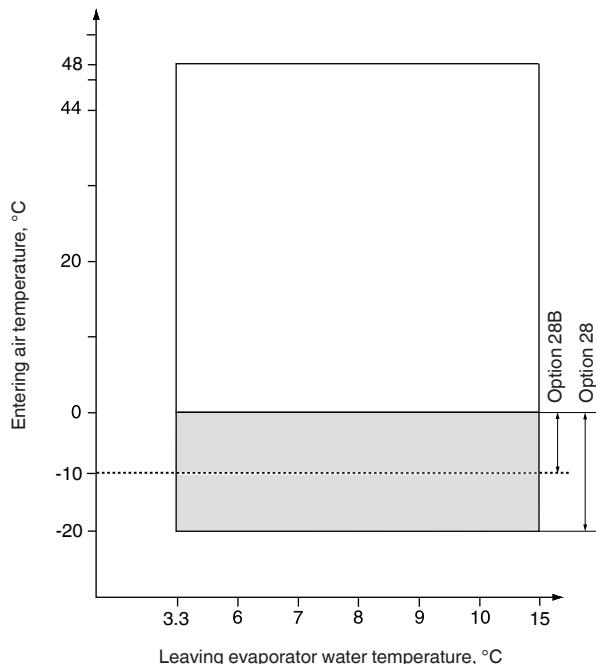

Evaporator water temperature, °C	Minimum	Maximum
Entering water temperature at shut-down	-	48
Entering water temperature at start-up	6.8	40
Entering water temperature during operation	6.8	25
Leaving water temperature during operation (plate heat exchanger)	5	15
Leaving water temperature during operation (shell-and-tube heat exchanger)	3.3	15

Condenser air temperature, °C	Minimum	Maximum
Standard unit	0	48
With winter operation option (No. 28)	-20	48
With winter operation option (No. 28B)	-10	48

Operating range - 30RB 162-262 "B" standard units (with plate heat exchanger)

Operating range - 30RB 162-262 "B" with option 280 (shell-and-tube heat exchanger) and 30RB 302-802

### Notes:

Evaporator  $\Delta T = 5$  K

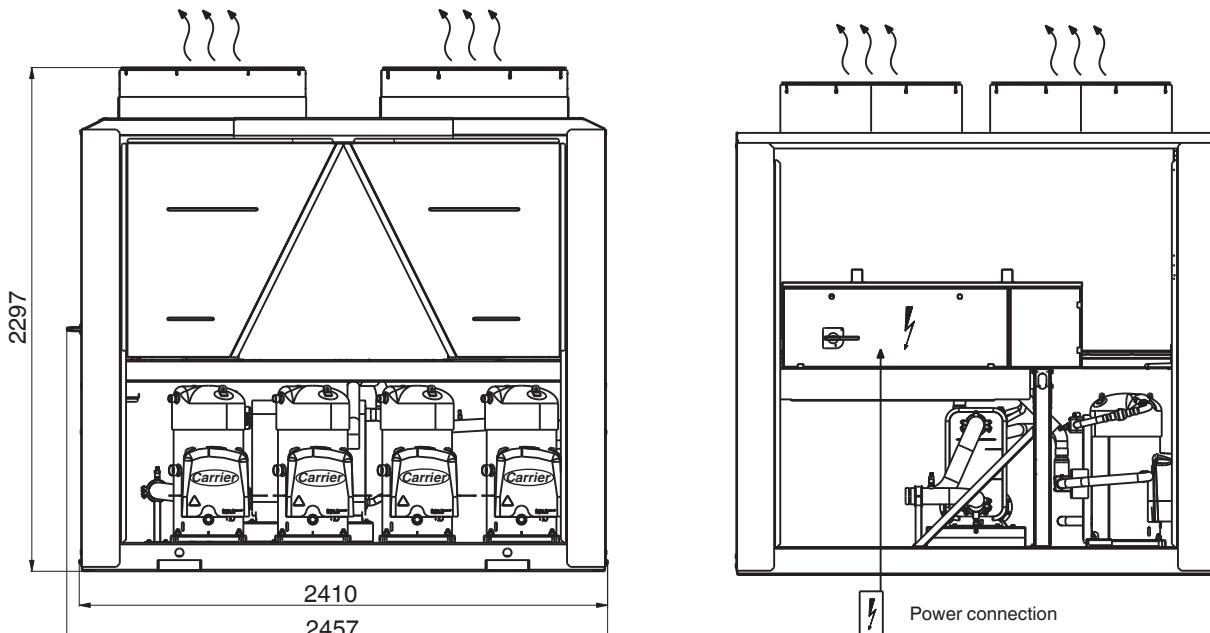

The evaporator is protected against frost down to -20°C.

### Legend:

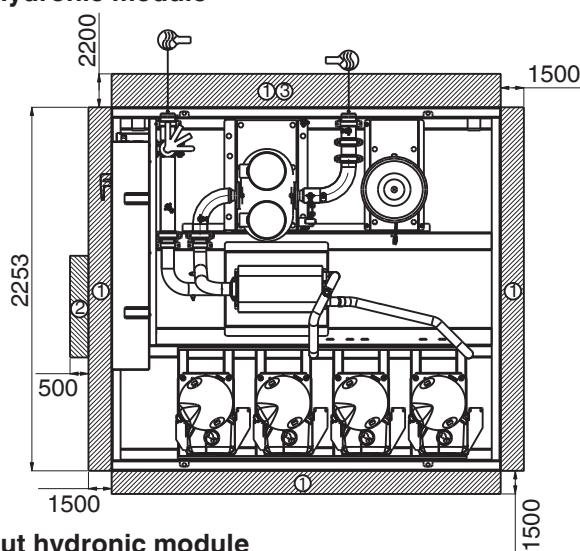

- Standard unit operating at full load.
- Operating range, units equipped with options 28 and 28B "Winter operation".
- Option 28 (with variable-speed lead fan for each circuit) allows operation down to -20°C outside temperature.
- Option 28B (with two-speed lead fan for each circuit) allows operation down to -10°C outside temperature.
- Moreover the unit must either be equipped with the evaporator frost protection option or the water loop must be protected against frost by the installer, using an anti-freeze solution.

# Dimensions/clearances

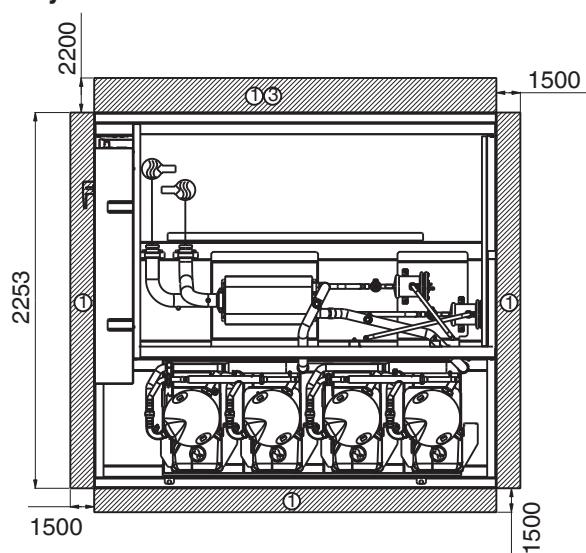

30RB 162-262 "B", standard units (with plate heat exchanger)

**Unit with hydronic module**

**Unit without hydronic module**

**Legend:**  
All dimensions are in mm.

- (1) Clearances required for maintenance and air flow
- (2) Clearances recommended for evaporator tube removal
- (3) Clearances recommended for heat exchanger removal

Water inlet

Water outlet

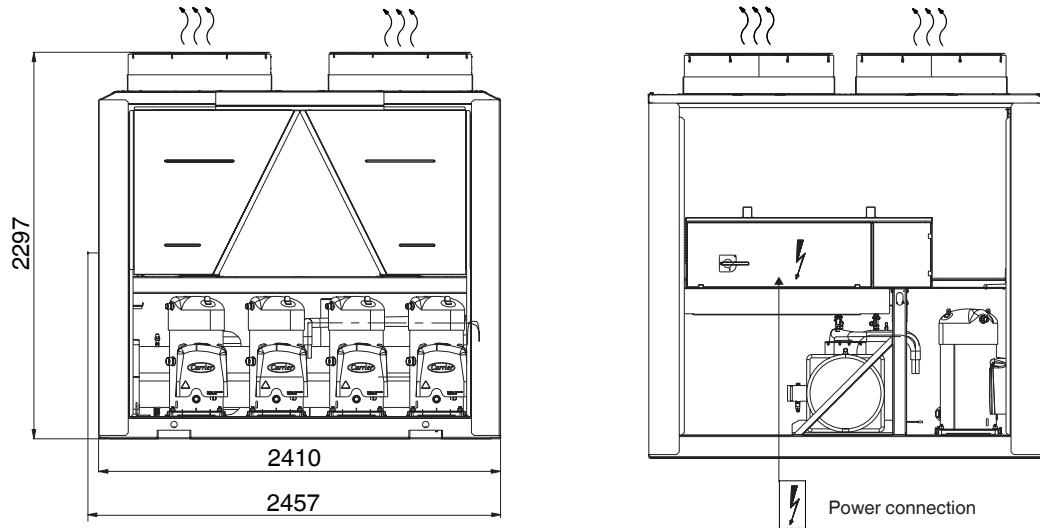

Air outlet, do not obstruct

**NOTE:** Drawings are not contractually binding. Before designing an installation, consult the certified dimensional drawings, available on request.

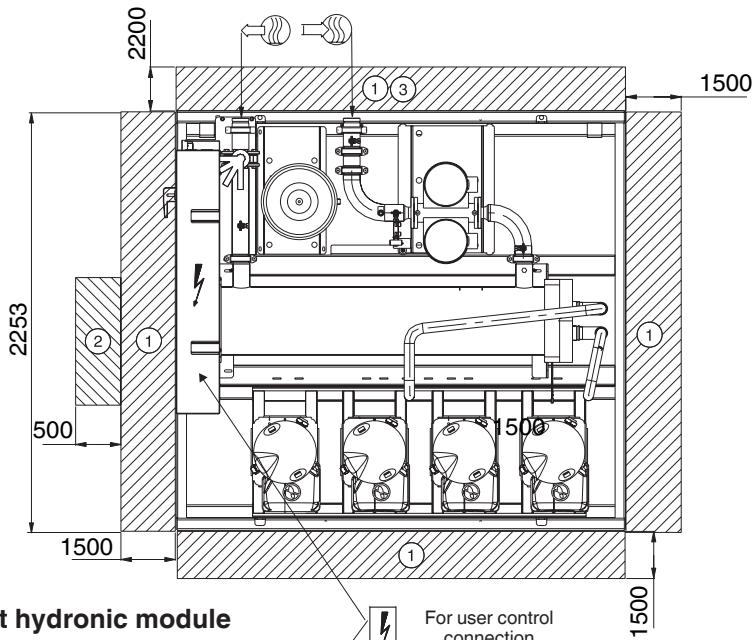

For the positioning of the fixing points, weight distribution points and centre of gravity coordinates please refer to the dimensional drawings.

# Dimensions/clearances

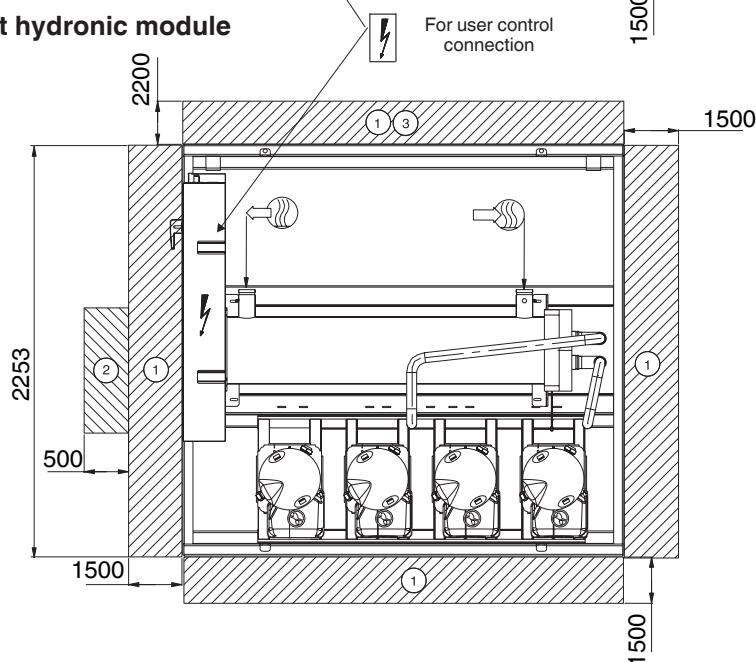

30RB 162-262 "B" with option 280 (shell-and-tube heat exchanger)

Unit with hydronic module

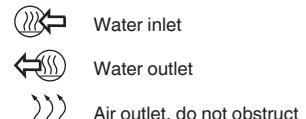

Unit without hydronic module

Legend:  
All dimensions are in mm.

- (1) Clearances required for maintenance and air flow
- (2) Clearances recommended for evaporator tube removal
- (3) Clearances recommended for heat exchanger removal

NOTE: Drawings are not contractually binding. Before designing an installation, consult the certified dimensional drawings, available on request.

For the positioning of the fixing points, weight distribution points and centre of gravity coordinates please refer to the dimensional drawings.

Legend:

- LWT Leaving water temperature
- CAP kW Cooling capacity
- COMP kW Compressor power input
- UNIT kW Unit power input (compressors, fans and control circuit)
- COOL I/s Evaporator water flow rate
- COOL kPa Evaporator pressure drop

**Application data:**

- Standard units, refrigerant: R-410A
- Evaporator temperature rise: 5 K
- Evaporator fluid: chilled water
- Fouling factor:  $0.18 \times 10^{-3} (\text{m}^2 \text{K})/\text{W}$

Performances in accordance with EN 14511.

Legend:

- LWT Leaving water temperature
- CAP kW Cooling capacity
- COMP kW Compressor power input
- UNIT kW Unit power input (compressors, fans and control circuit)
- COOL l/s Evaporator water flow rate
- COOL kPa Evaporator pressure drop

Application data:

- Standard units, refrigerant: R-410A
- Evaporator temperature rise: 5 K
- Evaporator fluid: chilled water
- Fouling factor:  $0.18 \times 10^{-4} (\text{m}^2 \text{K})/\text{W}$

Performances in accordance with EN 14511.

# Hydronic module (option 116)

The hydronic module option saves a lot of installation time. The chiller is factory-equipped with the main components for the hydronic system: screen filter, water pump, expansion tank, safety valve and water flow control valve.

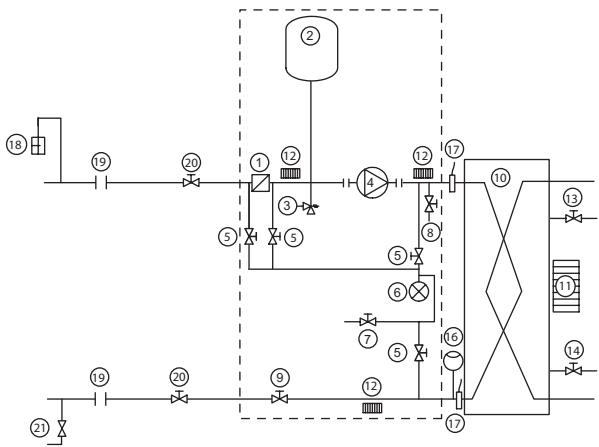

Several water pump types are available to suit any application: primary single or dual low-pressure pump or single or dual high-pressure pump (30RB 162-522).

An automatic pump start-up algorithm protects the heat exchanger and the hydronic module piping against frost down to -10°C outside temperature, if the evaporator frost protection option is installed. If necessary increased frost protection down to -20°C is possible by adding the heater option to the hydronic module piping (see options 41 and 42A).

The hydronic module option is integrated into the chiller without increasing its dimensions and saves the space normally used for the water pump.

Hydronic module

Typical hydronic circuit diagram

## Legend

### Components of unit and hydronic module

- 1 Victaulic screen filter
- 2 Expansion tank
- 3 Safety valve
- 4 Available pressure pump
- 5 Pressure tap valve (see Installation Manual)
- 6 Pressure gauge to measure the component pressure loss (see Installation Manual)
- 7 System vent valve, pressure gauge
- 8 Drain valve
- 9 Water flow control valve
- 10 Heat exchanger
- 11 Evaporator heater (option)
- 12 Hydronic module heater (option)
- 13 Air vent (evaporator)
- 14 Water purge (evaporator)
- 16 Flow switch
- 17 Water temperature sensor

### System components

- 18 Air vent
- 19 Flexible connection
- 20 Shut-down valves
- 21 Charge valve

--- Hydronic module (units with hydronic module)

### Notes:

With option 42A the unit hydronic module is protected against frost by electric heaters. The unit evaporator must be protected against frost (anti-freeze solution or optional electric heater)

# Partial heat reclaim using desuperheaters (option 49)

This option permits the production of free hot water using heat reclaim by desuperheating the compressor discharge gases. The option is available for the whole 30RB range.

A plate heat exchanger is installed in series with the air condenser coils on the compressor discharge line of each circuit.

# Total heat reclaim (option 50)

Suitable for heating, domestic hot water preparation, agriculture and food industry, industrial processes and other hot-water requirements.

With the total heat reclaim option it is possible to reduce the energy consumption bill considerably compared to conventional heating equipment such as fossil fuel boilers or electric water tanks.

## Operating principle

If hot water production is required, the compressor discharge gases are directed towards the heat reclaim condenser. The refrigerant releases its heat to the hot water that leaves the condenser at a temperature of up to 55°C. In this way 100% of the heat rejected by the liquid chiller can be used to produce hot water. When the demand for heat is satisfied, the hot gas is again directed towards the air condenser where the heat is rejected to the outside air by the fans. Hot water temperature control is ensured by the chiller Pro-Dialog control that independently controls the reclaim operation of each refrigerant circuit.

# DX free-cooling system (option 118A)

The DX free-cooling option permits significant energy savings for all applications that require cooling in winter. In the free-cooling mode the compressors are stopped and only the fan and cooling micro-pump are running. The changeover from compressor cooling mode to free-cooling mode is automatically controlled by the Pro-Dialog control, based on the chiller heat load and the temperature difference between chilled water and ambient air.

**Important:** In order to optimise chiller performances, it is recommended to use the leaving water set point reset function.

## Operating principle

When the chilled water-air temperature difference exceeds a threshold value, the Pro-Dialog control carries out a comparison between the instantaneous chiller cooling capacity and the available free-cooling capacity. If the operating conditions allow free-cooling operation, the compressors are stopped, a three-way valve on the suction piping connects the evaporator with the condenser, allowing the migration of the refrigerant vapours to the condenser. The refrigerant condenses in the condenser coils, and the cooling micro-pump transports the liquid to the evaporator. The cooling capacity in free-cooling mode is controlled by the opening of the electronic expansion valve (EXV).

 Unit kW - Unit power input (compressors, fans, control)  
 EER kW/kW - Energy efficiency

## Advantages of the DX free-cooling system

- Operation without glycol
  - Unlike traditional hydronic free-cooling systems that require the use of a glycol solution, the Aquasnap DX free-cooling chiller works with pure water. The evaporator is protected against frost down to -20°C by an electric resistance heater (option).
- Low water pressure losses
  - The Aquasnap DX free-cooling chiller does not include a three-way valve nor free-cooling coils connected in series with the evaporator. The Aquasnap free-cooling chiller has the same water pressure losses as a standard chiller.
- Weight and dimensions gain
  - The DX free-cooling option has little impact on the weight of the liquid chiller.
  - The Aquasnap free-cooling chiller has the same dimensions as a standard chiller.
- Increased energy efficiency
  - In free-cooling mode only the fans and the cooling micro-pump run. At an air-water temperature difference of 10 K for example the average chiller energy efficiency (EER) is 15 (kW/kW).
  - In the mechanical cooling mode chiller thermal and energy performances are not reduced by the use of a water-glycol solution.
  - As the pressure losses of the water circuit are low, the water pumps use less energy.

## Operating limits

30RB - compressor cooling mode				
Evaporator water temperature	°C	Minimum	Maximum	
Entering water at start-up		6.8	40	
Entering water during operation		8.5	25
