

AIR COOLED SCREW CHILLER

R407C REFRIGERANT

COOLING CAPACITIES
260 kW to 1194 kW

The YCAS range of chillers are designed for water or water-glycol cooling. Models are available with 2, 3 and 4 refrigerant circuits.

Semi-hermetic twin helical screw compressors are provided to ensure high operational efficiencies and reliable performance.

Optional heat recovery condensers or desuperheaters are available on 2 and 4 refrigerant circuit models

All units are designed to be located outside on the roof of a building or at ground level.

FEATURES	BENEFITS
Manufactured to ISO 9001 EN 29001.	High standard of quality control.
Two, three and four refrigerant circuits.	System stand-by security.
Constructed from heavy gauge painted galvanised steel.	Durable and weather protected.
High efficiency industrial type semi-hermetic twin helical screw compressor.	Energy efficient, long life reliable compressor.
Full factory run test.	Operating quality control.
Optional acoustic kit.	Reduces operating sound levels.
Optional Star/Delta compressor starter.	Reduced starting current.
Separate power and control compartments with lockable doors and emergency stop device.	Operator safety considerations.
Power compartment optional door interlocked isolators.	Operator safety convenience.
Microprocessor control with visual display of temperatures, pressures, motor currents, operating hours and number of starts.	System data logging and temperature reset capability. Fault diagnostics. Energy management.
Unit remote alarm contacts.	Warning notification.
Remote water temperature reset.	Improved operating efficiency.
Building management system interface.	For central data logging and single point full system monitoring and control.
Fuzzy logic.	Maximise capacity control.
Suction line heat exchanger and counter flow cooler.	Maximises chiller capacity and efficiency.

SPECIFICATION

The YCAS Air Cooled chiller shall be completely assembled with all interconnecting refrigerant piping and internal wiring, ready for field installation. The unit shall be pressure tested, evacuated, and fully factory charged with refrigerant and oil in each of the independent refrigerant circuits.

After assembly, an operational test shall be performed with water flowing through the cooler to ensure that each refrigerant circuit operates correctly.

The unit structure shall be manufactured from heavy gauge, galvanised steel and coated with baked-on powder paint (Desert Sand (RAL 1019)). This provides a finish which, when subjected to 500 hour, 5% salt spray conditions, shows breakdown of less than 3mm either side of a scribed line.

All exposed power wiring shall be routed through liquid-tight, non-metallic conduit.

Compressors

Each compressor shall be direct drive, semi-hermetic, rotary twin screw type and include the following items:

- Two screw rotors, with asymmetric profiles, manufactured from forged steel.
- A cast iron compressor housing precision machined to provide optimal clearance for the rotors.
- The entire compressor, from suction to discharge shall have a design working pressure of 31 bar.
- Capacity Control: The compressors shall start at the minimum load position and provide a capacity control range from 100% to 10% of the full chiller load using a continuous function slide valve. A microprocessor controlled output pressure regulating capacity control valve shall be supplied to command compressor capacity independent of control valve input pressure and to balance the compressor capacity with the cooling load.
- An automatic spring return of capacity control valve to the minimum load position to ensure compressor starting at minimum motor load.
- An internal discharge check valve to prevent rotor backspin upon shutdown.
- An acoustically tuned, internal discharge muffler to minimise noise at the source, while optimising flow for maximum performance.
- Discharge and suction shut-off service valves.
- A rain tight terminal box.
- A reliable suction gas cooled high efficiency, accessible hermetic motor with redundant overload protection using both thermistor and current overload protection.
- A suction gas screen and serviceable, 0.5 micron full flow oil filter within the compressor housing.
- A 350 W compressor body heater.

Oil Separator

Oil separators with a design working pressure of 31 bar shall be the high efficiency, augmented gas impingement type to maximise oil extraction without fragile media to break down.

Oil Cooler

Oil cooling shall be provided by a dedicated air-cooled finned tube type heat exchanger located in the condenser section of the unit.

Refrigerant Circuits

An independent refrigerant circuit shall be provided per compressor. Each circuit will use copper refrigerant pipe formed on computer controlled bending machines to reduce the number of brazed joints resulting in a reliable and leak resistant system.

Liquid line components shall include: manual shut-off valve with charging port, high absorption removable core filter-drier, solenoid valve, sight glass with moisture indicator, and thermostatic expansion valves.

Suction lines shall be covered with closed-cell insulation.

Cooler

The cooler shall be a special optimised 'Counter-Flow' heat exchanger, which will take advantage of the "Glide" characteristic of R407C. It will employ technologically advanced (patent pending) high efficiency tube assemblies which make possible a single refrigerant pass, delivering refrigerant suction gas warmer than the leaving chilled water at full load. An independent circuit shall be provided for each compressor. The shell design working pressure shall be 10.3 bar, and 23.8 bar for the tubes.

The cooler shall have water baffles fabricated from galvanised steel to resist corrosion, removable heads for access to internally enhanced, seamless, copper tubes. The water nozzles shall be provided with grooves for mechanical couplings and be insulated by the contractor after pipe installation. Water vent and drain connections shall also be included.

The cooler shall be equipped with a thermostatically controlled heater for protection to -29°C ambient and insulated with 19 mm flexible closed-cell foam.

Suction Line Heat Exchanger

Each refrigerant circuit utilises a refrigerant to refrigerant, compact, shell and tube type suction line heat exchanger to maximise chiller capacity and efficiency by subcooling liquid refrigerant delivered to the expansion valve and superheating suction gas delivered to the compressor. The design working pressure shall be 31 bar. The exchanger shall be constructed in accordance with applicable pressure vessel safety code.

Condenser

Fans - The fans shall be dynamically and statically balanced, direct drive with corrosion resistant glass fibre reinforced composite blades moulded into low sound, full airfoil cross section, providing vertical air discharge from extended orifices for efficiency and low sound. Each fan shall be located in a separate compartment to prevent cross flow during fan cycling. Guards of heavy gauge, PVC (polyvinyl chloride) coated galvanised steel shall be provided.

Motors - The fan motors shall be the high efficiency, direct drive, 6 pole, 3 phase, Class-"F", current overload protected, totally enclosed (TEAC) type with double sealed, permanently lubricated, ball bearings.

Coils - Fin and tube condenser coils shall be manufactured from seamless, internally enhanced, high condensing coefficient, corrosion resistant copper tubes arranged in staggered rows and mechanically expanded into corrosion resistant black fin aluminium alloy with full height fin collars. The design working pressure shall be 31 bar and each coil shall be pressure tested to 34 bar.

Power and Control Panel

All controls and motor starting equipment necessary for unit operation shall be factory wired and function tested.

The panel enclosure shall be designed to IP55 (rain/dust tight) and be manufactured from powder painted galvanised steel.

The Power and Control Panel shall be divided into a power section for each electrical system, a control section and an electrical options section.

Power and control sections shall have a separate hinged, latched, and gasket sealed door equipped with wind struts for safer servicing.

Each power compartment shall contain:

Compressor and fan starting contactors, fan motor external overloads, control circuit serving compressor capacity control, compressor and fan contactor coils and compressor motor overloads.

Compressor Motor Overloads: Current transformers sense each phase, as an input to the microprocessor, to protect compressor motors from damage due to: low input current, high input current, unbalanced current, single phasing, phase reversal, and compressor locked rotor.

The control section shall contain:

On/Off toggle switch, microcomputer keypad and display, microprocessor board, I/O expansion board, relay boards and power supply board.

The options section shall contain:

A control circuit transformer providing 115/110 power to the unit control system.

Electrical options as described in "Accessories and Options".

Micropocessor Controls

Fuzzy Logic control will be incorporated in the YCAS range of chillers. Fuzzy logic allows the control system to monitor several key variables to provide tighter, more stable, chilled water temperature control. The control system monitors the leaving chilled water temperature to track where it has been, where it is now, how fast it is moving, and accurately adjusts chiller operation in anticipation of expected performance to minimise hunting and save energy.

The microprocessor shall have the following functions and displays:

- A liquid crystal 40 character display with text provided on two lines and light emitting diode backlighting for outdoor viewing.
- A colour coded, 35 button, sealed keypad with sections for Display, Entry, Setpoints, Clock, Print, Program and Unit On/Off switch.
- The standard controls shall include: brine chilling or thermal storage, automatic pump down, run signal contacts, demand load limit from external building automation system input, remote reset liquid temperature reset input, unit alarm contacts, chilled liquid pump control, automatic reset after power failure, automatic system optimisation to match operating conditions, software stored in non-volatile memory (EPROM) to eliminate chiller failure due to AC power failure.
- Programmed Setpoint shall be retained in a lithium battery backed RTC memory for a minimum of 5 years.

DISPLAY – In Metric (°C and Bar) or English (°F and psi) units. For each circuit, the following items shall be displayed:

- Return and leaving chilled liquid, and ambient temperature.
- Day, date and time. Daily start/stop times. Holiday and Manual Override status.
- Compressor operating hours and starts. Automatic or manual lead/lag. Lead compressor identification.
- Run permissive status. No cooling load condition. Compressor run status.
- Anti-recycle timer and anti-coincident start timer status per compressor.
- System suction (and suction superheat), discharge, and oil pressures and temperatures.
- Percent full load compressor motor current. Compressor capacity control valve input steps.
- Cut-out status and set-points for: supply fluid temperature, low suction pressure, high discharge pressure and temperature, high oil temperature, low and high ambient, high and low current, and low leaving liquid temperature.
- Unloading limit setpoints for high discharge pressure and compressor motor current.
- Liquid pull-down rate sensitivity (0.3°C to 3°C/minute in 0.05°C increments).
- Status of: evaporator heater, condenser fans, load and unload timers, chilled liquid pump.
- "Out of range" message.
- Up to 6 fault shut down conditions.
- Standard Display Language is English, with other language options.

ENTRY – Enter set point changes, cancel inputs, advance day, and change AM/PM.

SET POINTS – Chilled liquid temperature, chilled liquid range, remote reset temperature range.

CLOCK – Time, daily or holiday start/stop schedule, manual override for servicing.

PRINT – Operating data or system fault shutdown history for last six faults, and software version. Printouts through an RS-232 port via a separate printer (by others).

PROGRAM – Low leaving liquid temperature cutout, 300 to 600 second anti-recycle timer, lag compressor start time delay, average motor current unload point, liquid temperature set-point reset signal from YORK ISN or building automation system (by others) via:

- Pulse width modulated (PWM) input for up to 22°C total reset as standard.
- *Optional* Building Automation System interface input card for up to 11°C reset using a 4 to 20 mA, 0 to 10 Vdc input, or discrete reset input.
- **[NOTE:** The Standard microprocessor can be directly connected to a YORK ISN Building Automation System via the standard on-board RS485 communication port. This Option also provides open system compatibility with other communications networks (BACNET™ & LONMARK™) via interface through standard onboard 485 or 232 port and an external YorkTalk Translator.]
- Additional functions (password protected) for programming by a qualified service technician:
- Cut-outs for low and high ambient, low suction pressure, high discharge pressure, high oil temperature.
- Refrigerant type.
- High discharge pressure unload setpoint.
- Fan control discharge pressure set point.
- Fan ON/OFF pressure differential.
- Compressor motor current percent limit.
- The Standard unit controls permit operation down to -18°C outdoors ambient temperature.

Motor Protection

The microprocessor motor protection provides high current protection to ensure that the motor is not damaged due to voltage, excess refrigerant or other problems that could cause excessive motor current.

The microprocessor also provides low motor current protection when it senses a motor current of less than 10% FLA.

A motor protector module provides thermal and current motor overload protection. The module also protects against phase to phase current imbalance, over current, under current and phase rotation.

Option 2.5/2.5x Supply to Control System Non-Fused Switch Disconnect derived internally from common electrical power.

Multi Point Power Supply Connection:

Two field provided 400 V, 3Ø, 50 Hz supplies to the unit with circuit protection.

Single Point Power Supply Connection:

One field provided 400 V, 3Ø, 50 Hz supply to the unit with circuit protection.

Power Factor Correction

Factory mounted passive (static) correction capacitors to correct unit compressor power factors to 0.95 (depending on operating conditions).

Star-Delta Compressor Motor Starter

Provides approximately 65% reduced inrush current compared to direct on-line starting (Factory Mounted).

Closed Transition Star/Delta Start

With the addition of closed transition contactors and resistors the change over spike during starting can be reduced to nearer the star inrush level thus reducing the risk of electrical interference during compressor start.

OptiView™ Control panel

Field mounted remote control panel, used to monitor and control remote York air cooled chillers from an indoor location. Each panel can control up to 8 chillers.

Remote Control Panel and Wall Adaptor

Field mounted remote control panel. (Cannot be fitted when a (BAS) Interface or Multi-unit Sequence Control is fitted).

Multi-unit Sequence Control

A factory mounted Sequencing Control Centre to manage sequencing control of up to eight chillers in parallel based on mixed liquid temperature (interconnecting wiring by others). (Cannot be fitted when a (BAS) Interface or Remote Control Panel is fitted).

Building Automation System (BAS) Interface

Provides a means to reset the leaving chilled liquid temperature and/or percent full load amps (current limiting) from the BAS (Factory Mounted):

Printed circuit board to accept 4 to 20 mA, 0 to 10 Vdc, or dry contact closure input from the BAS.

(Cannot be fitted when a Multi-unit Sequence Control or Remote Control Panel is fitted).

Note: A YORK ISN Building Automation System can provide a Pulse Width Modulated (PWM) signal direct to the standard control panel via the standard on-board RS485 port.

Flow Switch Accessory

Johnson Controls model F61MG-1C Vapour-proof SPDT, NEMA 4X switch, 10.3 bar DWP, -29°C to 121°C, with 1" NPT (IPS) connection for upright mounting in horizontal pipe. A flow switch must be field installed with each unit.

High Static Pressure Fans

Fans and motors suitable for high external static conditions to 150 Pa.

OTHER OPTIONS

Heat Recovery

(2 and 4 Refrigerant Circuit Models only) Factory fitted plate heat exchanger(s) to provide warm water during cooling to satisfy heating and domestic hot water requirements.

Desuperheaters

(2 and 4 Refrigerant Circuit Models only) Factory fitted desuperheaters on compressor discharge lines to provide hot water during cooling.

Alternative Condenser Coils:

Copper fin condenser coils – Condenser coils are constructed with corrosion resistant copper fins.

Blygold Protective Coating - is recommended for corrosive applications, such as coastal locations where salt spray may hit the condenser fins.

Un-coated aluminium fin stock is available as an option.

DX Cooler Options:

21 Bar Waterside Design Working Pressure – The DX cooler waterside is designed and constructed for 21 bar working pressure. (Factory Mounted)

Flange Accessory – Consists of raised face flanges to convert grooved water nozzles to flanged cooler connections. Includes companion flanges for field mounting.

Unit Enclosures

Wired guards – Heavy gauge welded wire mesh guards mounted over the exterior condenser coil faces and around the bottom of the unit (factory mounted).

Sound Reduction Options

Low sound fans – Reduced RPM fan motors and alternative fan selection for low sound applications.

Compressor sound enclosures – Acoustically treated flexible compressor enclosures.

Acoustic Kit I – Comprises low sound fans and compressor sound enclosures.

Acoustic Kit II – Comprises low sound fans, compressor sound enclosures and fan speed inverters.

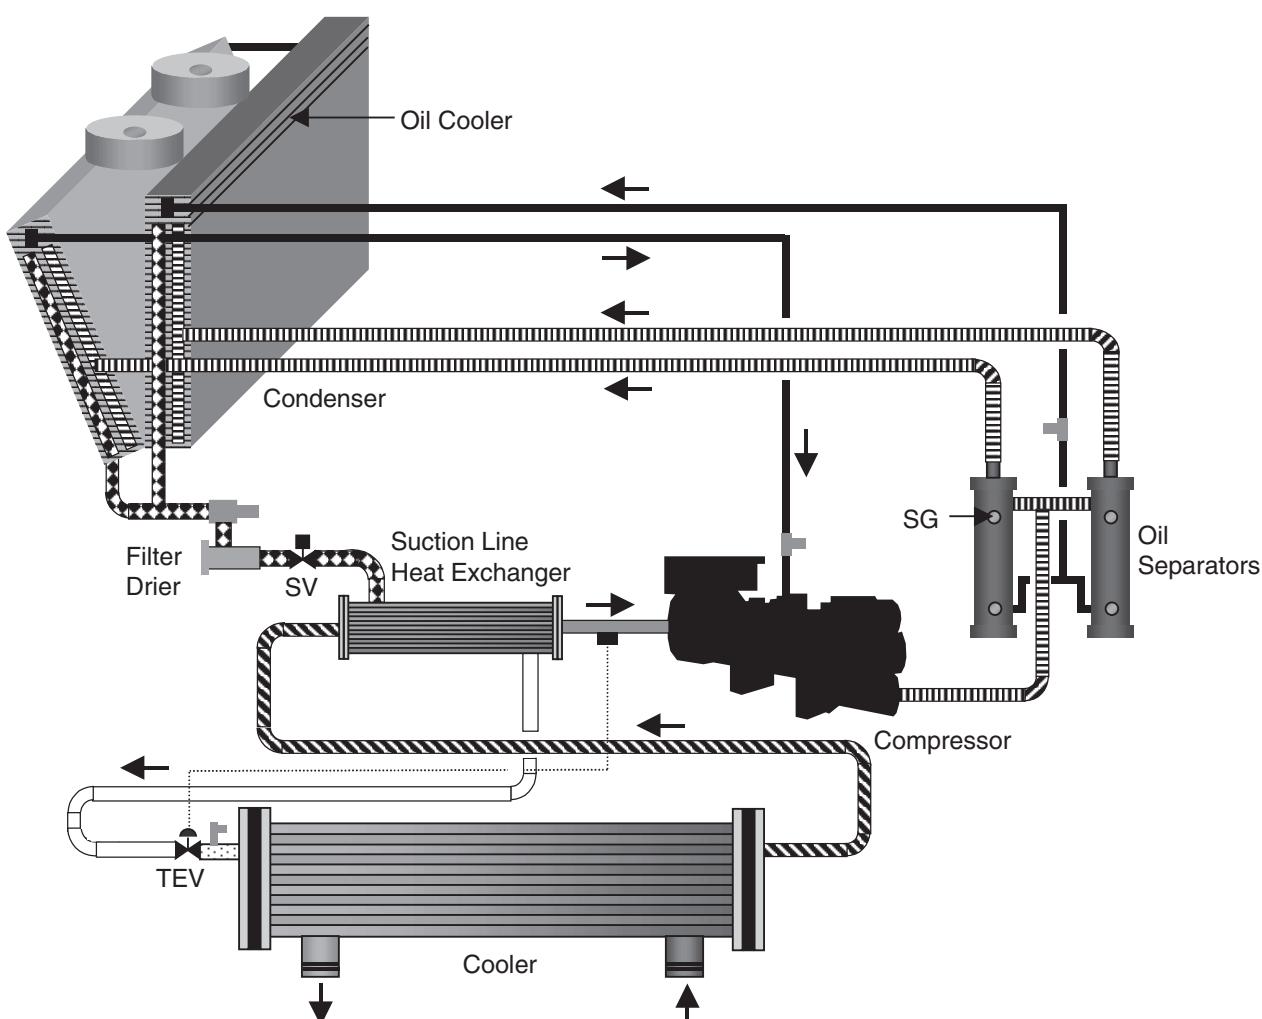

Acoustic Kit III – Comprises low sound fans, fan baffles and side and end intake silencers.

Acoustic Kit IV (ELS) – Comprises low sound fans, fan baffles, side and end intake silencers, compressor sound enclosures and fan speed inverters.

Vibration Isolation

25 mm spring isolators – Level adjustable, spring and cage type isolators for mounting under the unit base rails (Field mounted).

50 mm seismic spring isolators – Restrained Spring-Flex Mountings incorporate welded steel housing with vertical and horizontal limit stops. Housings designed to withstand a minimum 1.0 g accelerated force in all directions to 50 mm. Level adjustable, deflection may vary slightly by application (Field mounted).

High Pressure Subcooled Liquid	Low Pressure Saturated Vapour
Low Pressure Liquid	Low Pressure Superheated Vapour
High Pressure Liquid	High Pressure Superheated Vapour
Oil	SV = Solenoid Valve
	SG = Sight Glass
	TEV = Thermostatic Expansion Valve

Note: Only one refrigerant circuit shown.

Cooling (Figure 1)

Low pressure liquid refrigerant from the expansion valve (TEV) enters the counter-flow cooler tubes and is evaporated by the heat energy absorbed from the chilled water passing through the shell. The refrigerant leaves the cooler in a saturated vapour state.

High pressure liquid refrigerant, from the condenser, enters the suction line heat exchanger shell and superheats the refrigerant vapour entering the tubes from the cooler. The low temperature liquid refrigerant, leaving the exchanger to the cooler, has been sub-cooled by the refrigerant vapour in the exchanger tubes.

Low-pressure superheated vapour enters the compressor where pressure and superheat are increased. High pressure vapour is passed through the oil separator where compressor oil is removed and recirculated to the compressor via the oil cooler. The high pressure oil-free vapour is fed to the air cooled condenser coil and fans where the heat is removed. The high pressure liquid refrigerant returns to the expansion valve via the suction line heat exchanger.

Optional Heat Recovery (Figure 1a)

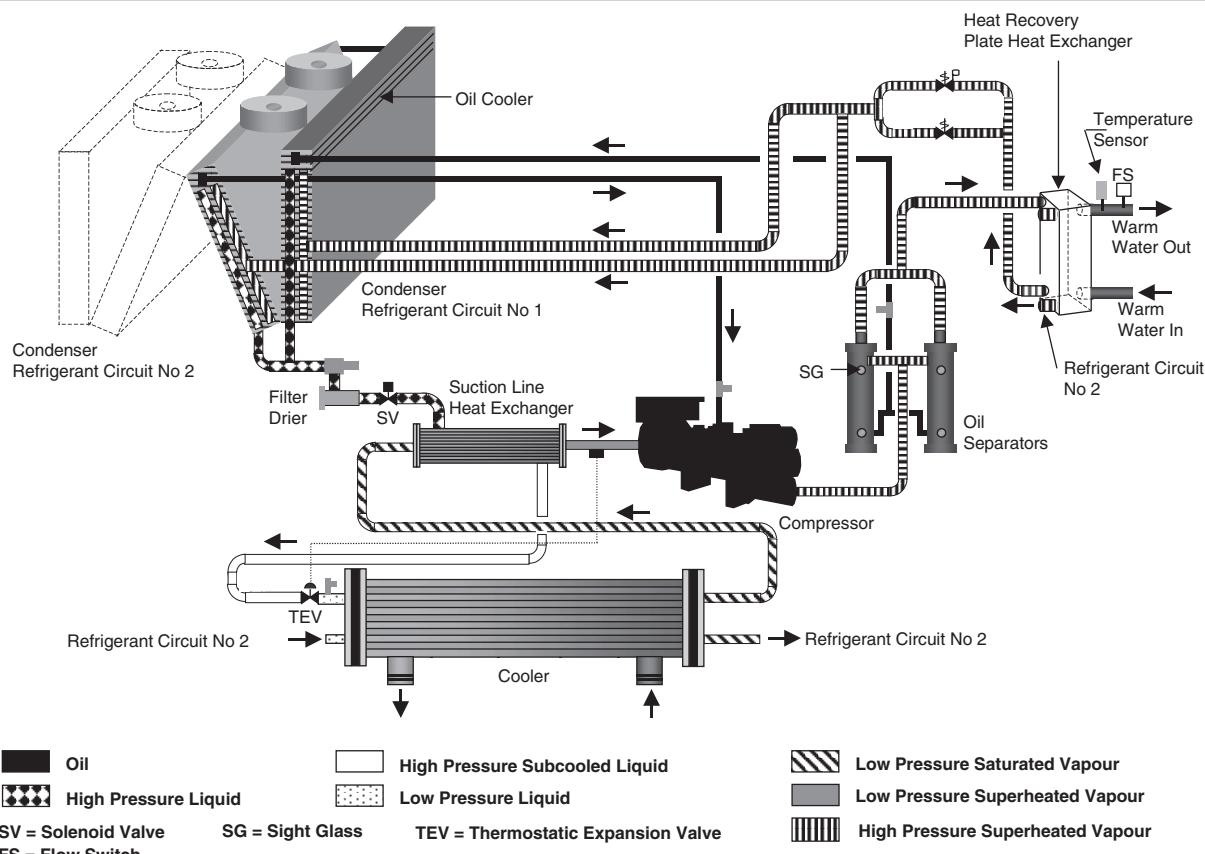

If the warm water flow switch detects water flow the heat recovery pressure regulating valves are energised. The valves allow high-pressure superheated refrigerant, from the oil separators, to enter the twin circuit heat recovery plate heat exchanger. The refrigerant is partially condensed as the warm water absorbs heat energy.

The valves are de-energised when the leaving warm water temperature sensor registers the high point of the set point dead band. If water flow is maintained the valves are re-energised if the temperature sensor registers the low point of the set point dead band.

SELECTION GUIDE

DATA REQUIRED

To select a YORK YCAS chiller the following information is required:

1. Required cooling capacity.
2. Design chilled water entering and leaving temperatures.
3. Design water flow rate if one of the temperatures in item 3 are unknown.
4. Design condenser entering air temperature. This will normally be the design summer ambient air temperature unless location or other factors have an influence.
5. Altitude above sea level.
6. Design cooler fouling factor.
7. Static pressure resistance against condenser entering and leaving air flow (where ducts, louvres, attenuators, etc., are used) at full unit air volume.

Note: Items 1, 2 and 3 must be linked by the following formulae:

$$\text{Cooling Capacity (kW)} = \text{Range } (\text{°C}) \times \text{Flow (litres/sec)} \times 4.18$$

Where:

Range = Entering liquid temperature - Leaving liquid temperature.

CHILLER SELECTION METHOD

1. Determine the correct size of chiller by selecting the model which most closely matches the required capacity at the design conditions of leaving water temperature and entering air temperature (Table 7).
2. Apply correction factors for fouling factor (Table 3) and altitude & fan application (Tables 4 & 5) to the capacity and power values from the capacity tables (Table 7). Ensure the corrected capacity is still sufficient for requirements.
3. Using the corrected capacity of the selected chiller adjust the design temperature range, or flow rate, to balance the formulae shown in "Data Required".
4. Physical and electrical data can now be determined from Tables 9 and 10.
5. Always re-check that selections fall within the design limitations specified in Table 2.

TABLE 3

COOLER

	20	0.99	1.01
High Pressure Fans	150	1.00	1.00

COOLING ONLY CHILLER SAMPLE SELECTION

A chiller is required to cool water from 12°C to 7°C having a cooling capacity of 575 kW at a design flow rate of 28 l/s. Other design conditions applying are:

Ambient air entering condenser:	35°C
Fouling factor:	0.044 m ² °C./kW
Altitude:	Sea level
Condenser air restriction:	None

From a cursory examination of Capacity Table 7, a model 0605EB gives approximately the required capacity:

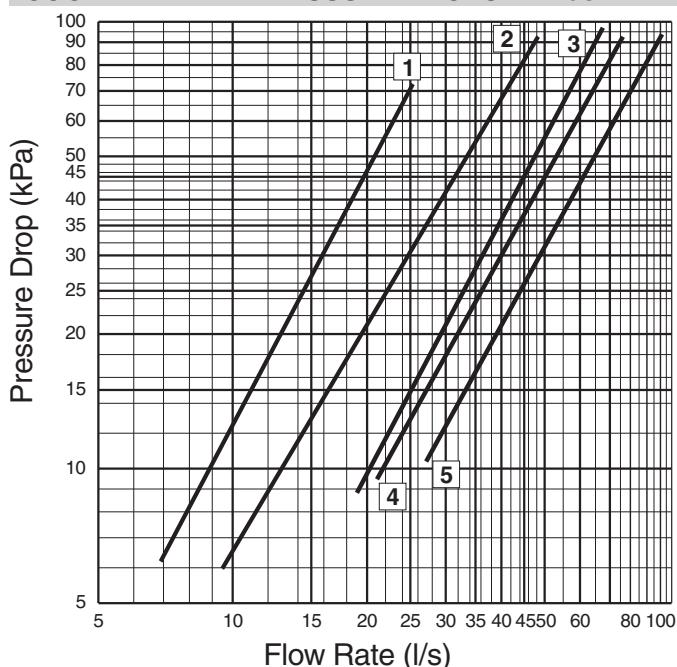

Capacity	= 584 kW
Compressor power	= 179.7 kW

No correction factors apply therefore, after calculating the flow rate, the conditions will be as follows:

Cooling capacity:	584 kW
Water temperature:	12°C to 7°C (Range = 5°C)
Water flow rate:	27.95 l/s
Compressor power:	179.7 kW

All values are within the operating limits in Table 2. From Pressure Drop Graph (Figure 2), YCAS0605EB cooler water pressure drop = 36.7 kPa at the calculated flow of 27.95 l/s.

COOLER WATER PRESSURE DROPS FIGURE 2

OPTIONAL HEAT RECOVERY SAMPLE SELECTION

A chiller is required to cool water from 12°C to 7°C having a cooling capacity of approximately 575 kW at a design flow rate of 28 l/s. Other design conditions applying are:

Ambient air entering condenser:	35°C
Fouling factor:	0.044 m ² °C./kW
Altitude:	Sea level
Condenser air restriction:	None
Required leaving Temperature	50°C
Hot water temperature range	12°C

A model 0605EB meets the cooling requirements, see sample selection opposite.

From Table 8 a model 0605EB gives the following data when providing hot water at 50°C.

LWT	Cool (kW)	Power (kW)	Heat (kW)
7°C	510	226	393

The heating capacity should be corrected for the hot water temperature range Table 6: 393 kW x 1.02 = 400.8

$$\text{Heat recovery water flow: } \frac{400.8}{12^\circ\text{C} \times 4.18} = 7.99 \text{ l/s}$$

Heat recovery pressure drop from graph (Figure 3) is 46 kPa at the calculated flow of 7.99 l/s.

TEMPERATURE RANGE FACTORS TABLE 6

Temperature Range	Capacity Factor	Temperature Range	Capacity Factor
8	0.98	11	1.01
9	0.99	12	1.02
10	1.00	13	1.03
		14	1.04

FIGURE 3 HEAT RECOVERY PRESSURE DROP

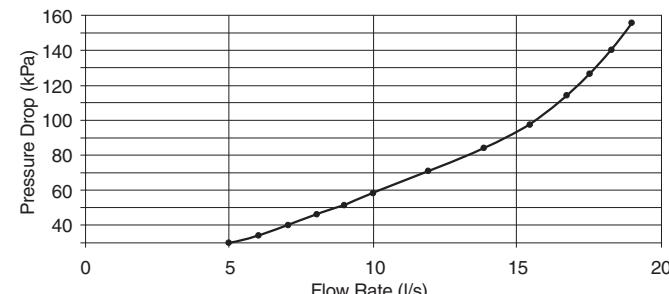

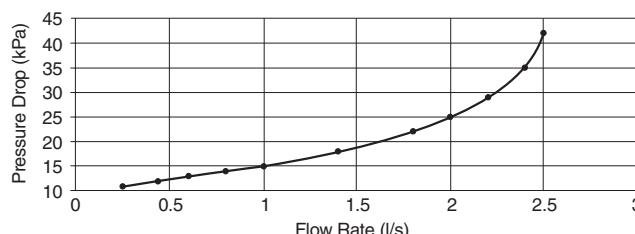

FIGURE 4 DESUPERHEATERS PRESSURE DROP

The water pressure drop values shown in figures 3 and 4 are for two refrigerant circuit models with flow rates based on 10°C hot water temperature range.

On four refrigerant circuit models two heat recovery condensers or two pairs of desuperheaters are fitted. Both options are to have their heat exchanger water circuits connected in parallel.

When connected in this configuration the water flow will be equally divided through the heat exchangers, therefore the total flow should be divided by 2 when calculating the pressure drop.

Model	Line	Pressure Drop Calculation
0295, 0335, 0375	1	Pressure Drop [kPa] = 0.1556 x (Flow Rate [l/s] ^{1.9004})
0425, 0475, 0515, 0555, 0575, 0605	2	Pressure Drop [kPa] = 0.1320 x (Flow Rate [l/s] ^{1.6901})
0685	3	Pressure Drop [kPa] = 0.0396 x (Flow Rate [l/s] ^{1.8523})
0775, 0835, 0905, 0965	4	Pressure Drop [kPa] = 0.0394 x (Flow Rate [l/s] ^{1.7935})
1065, 1135, 1215	5	Pressure Drop [kPa] = 0.0396 x (Flow Rate [l/s] ^{1.6837})

Heat recovery capacities (Heat) are for a leaving hot water temperature range of 10°C, where range = leaving liquid temperature - entering liquid temperature.
Total heat recovery capacities shown are for both heat recovery condensers piped in parallel.

(1) Sound Pressure levels are 10 m from the Control Panel, at a height of 1.6 m from the unit base.

Levels may vary at different positions around the unit.

(2) Length excludes switch disconnect and/or circuit breaker handles.

(3) The unit length is increased by 300 mm and the width is increased by 600 mm with optional Acoustic Kit III or IV fitted.

(4) Shipping weights are Operating Weight - 140 kg (models 0295, 0335 and 0375) or Operating Weight - 300 kg (models 0425 and 0475).

Weights with Acoustic Kits fitted include the intake silencers which are fitted on site.

Electrical Data Notes

Nominal conditions are taken at 7°C leaving chilled liquid temperature and 35°C condenser air entering temperature.

Maximum NamePlate conditions allowed by compressor motor protection.

Total Unit values are for all compressors and fans running. That is, system 1 & 2.

System 1, are values for one or two compressors with respective condenser fans running.

System 2, are values for one or two compressors with respective condenser fans running.

Starting Amps is the maximum inrush current (per compressor) when Star Delta or Direct on Line starting is employed at 400 V.

Model YCAS EB	High Pressure Fan Chillers						Largest Compressor Starting Amps	Starting Amps per Fan	Nominal Running Amps per Fan			
	Nominal Running Amps			Maximum Running Amps								
	Total Unit Amps	System 1 Amps	System 2 Amps	Total Unit Amps	System 1 Amps	System 2 Amps						
0295	170	85	85	246	123	123	175	523	48.3			
0335	213	128	85	291	168	123	232	732	48.3

Electrical Data Notes

Nominal conditions are taken at 7°C leaving chilled liquid temperature and 35°C condenser air entering temperature.

Maximum NamePlate conditions allowed by compressor motor protection.

Total Unit values are for all compressors and fans running. That is, system 1 & 2.

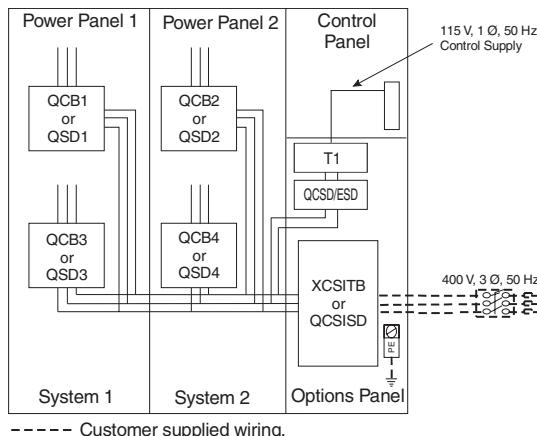

System 1, are values for one or two compressors with respective condenser fans running.

System 2, are values for one or two compressors with respective condenser fans running.

Starting Amps is the maximum inrush current (per compressor) when Star Delta or Direct on Line starting is employed at 400 V.

2, 3 AND 4 REFRIGERANT CIRCUIT MODELS CONNECTION DIAGRAMS

Single Point Power Supply Connection - All Models with Terminal Block or Non-Fused Switch Disconnect (Options 2.4, 2.4x, 2.5 or 2.5x)

Model YCAS	Terminal Block Wire Range (mm ²)	N-F Switch Disconnect Wire Range (mm ²)	Terminal Block Connection
0295	70 - 240	25-150	
0335	70 - 240	(2) 95-120	
0375	(2) 50 - 150	(2) 95-120	
0425	(2) 50 - 150	(2) 95-120	
0475	(2) 70 - 240	(3) 95-185	
0515	(2) 50 - 150	(2) 95-120	
0555	(2) 70 - 240	(3) 95-185	
0575	(2) 70 - 240	(3) 95-185	
0605	(2) 70 - 240	(3) 95-185	
0685	(2) 70 - 240	(2) 120 - 240	Non-Fused Switch Disconnect Connection
0775	(2) 70 - 240	(2) 120 - 240	
0835	(2) 70 - 240	(2) 120 - 240	
0905	(3) 50 - 150	(3) 95-185	
0965	(3) 50 - 150	(3) 95-185	
1065	(3) 70 - 240	(3) 95-185	
1135	(3) 70 - 240	(4) 95-240	
1215	(3) 70 - 240	(4) 95-240	

Note: Figures in brackets denote the number of available connections per phase.

For example (2) 95 - 120 mm² - can take 2 cables at the stated wire range.

One field provided 400 V, 3Ø, 50 Hz supply to the unit with circuit protection. Field connections to factory provided Terminal Block (XCSITB) or Non-Fused Switch Disconnect (QCSISD) in the Options Panel.

Options 2.4 and 2.5: Internal branch Circuit Breakers (QCB) for each circuit in the two Power Panels.

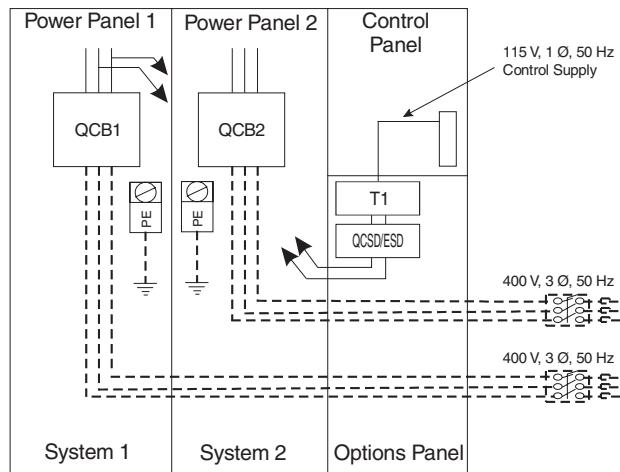

Options 2.4x and 2.5x: Internal branch Non-Fused Switch Disconnects (QSD) and Fuses for each circuit in the two Power Panels.

Options 2.4 and 2.4x: The control circuit supply is derived internally from Electrical System 1 (Circuit 1) which then feeds the Non-Fused Switch Disconnect (QCSD/ESD) and Control Transformer (T1) in the Options Panel.

Options 2.5 and 2.5x: The control circuit supply is derived internally from the common supply which then feeds the Non-Fused Switch Disconnect (QCSD/ESD) and Control Transformer (T1) in the Options Panel.

2, 3 AND 4 REFRIGERANT CIRCUIT MODELS CONNECTION DIAGRAMS

Multi-Point Power Supply Connection - Models 0295 to 0605 with Door Interlocked Circuit Breakers (Option 2.1)

Model YCAS	System 1 Wire Range (mm ²)	System 2 Wire Range (mm ²)	Circuit Breaker Connection
0295	25 -150	25 -150	
0335	25 -150	25 -150	
0375	25 -150	25 -150	
0425	25 -150	25 -150	
0475	(2) 95 - 120	(2) 95 - 120	
0515	25 -150	25 -150	
0555	(2) 95 - 120	(2) 95 - 120	
0575	(2) 95 - 120	(2) 95 - 120	
0605	(2) 95 - 120	(2) 95 - 120	

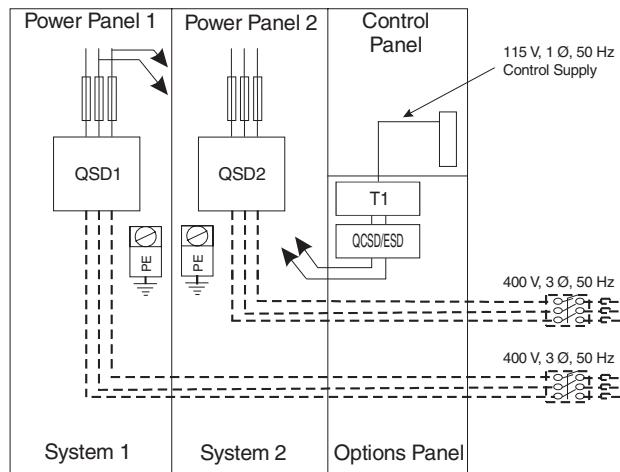

Note: Figures in brackets denote the number of available connections per phase.
For example (2) 95 - 120 mm² - can take 2 cables at the stated wire range.

----- Customer supplied wiring.

Two field provided 400 V, 3Ø, 50 Hz supplies to the unit with circuit protection. Field connections to factory provided Circuit Breakers (QCB) in each of the two Power Panels.

The control circuit supply is derived internally from Electrical System 1 which then feeds the Non-Fused Switch Disconnect (QCSD/ESD) and Control Transformer (T1) in the Options Panel.

Multi-Point Power Supply Connection - Models 0295 to 0605 with Door Interlocked Non-Fused Switch Disconnects and Fuses (Option 2.1x)

Model YCAS	System 1 Wire Range (mm ²)	System 2 Wire Range (mm ²)	Non-Fused Switch Disconnect Connection
0295	70 -120	70 -120	
0335	70 -120	70 -120	
0375	70 -120	70 -120	
0425	95 -185	95 -185	
0475	95 -185	95 -185	
0515	95 -185	95 -185	
0555	95 -185	95 -185	
0575	95 -185	95 -185	
0605	95 -185	95 -185	

Note: Figures in brackets denote the number of available connections per phase.
For example (2) 95 - 120 mm² - can take 2 cables at the stated wire range.

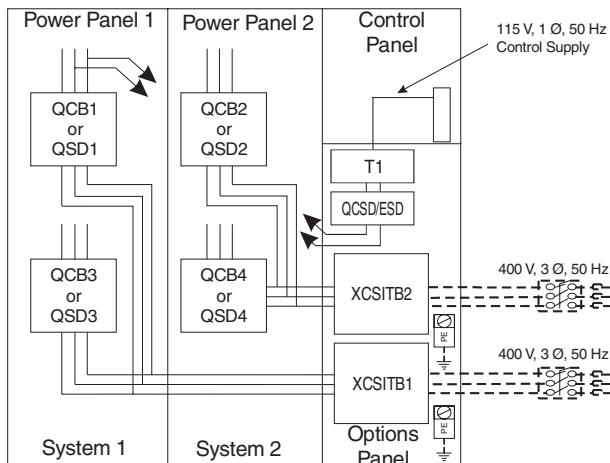

----- Customer supplied wiring.

Two field provided 400 V, 3Ø, 50 Hz supplies to the unit with circuit protection. Field connections to factory provided Non-Fused Switch Disconnects (QSD) in the two Power Panels.

The control circuit supply is derived internally from Electrical System 1 which then feeds the Non-Fused Switch Disconnect (QCSD/ESD) and Control Transformer (T1) in the Options Panel.

2, 3 AND 4 REFRIGERANT CIRCUIT MODELS CONNECTION DIAGRAMS

Multi-Point Power Supply Connection - Models 0685 to 1215 with Terminal Blocks (Options 2.2 and 2.2x)

Model YCAS	System 1 Wire Range (mm ²)	System 2 Wire Range (mm ²)	Terminal Block Connection
0685	(2) 35 - 95	35 - 95	
0775	(2) 35 - 95	35 - 95	
0835	(2) 50 - 150	35 - 95	
0905	(2) 50 - 150	50 - 150	
0965	(2) 50 - 150	50 - 150	
1065	(2) 35 - 95	(2) 35 - 95	
1135	(2) 50 - 150	(2) 50 - 150	
1215	(2) 50 - 150	(2) 50 - 150	

Note: Figures in brackets denote the number of available connections per phase.
For example (2) 95 - 120 mm² - can take 2 cables at the stated wire range.

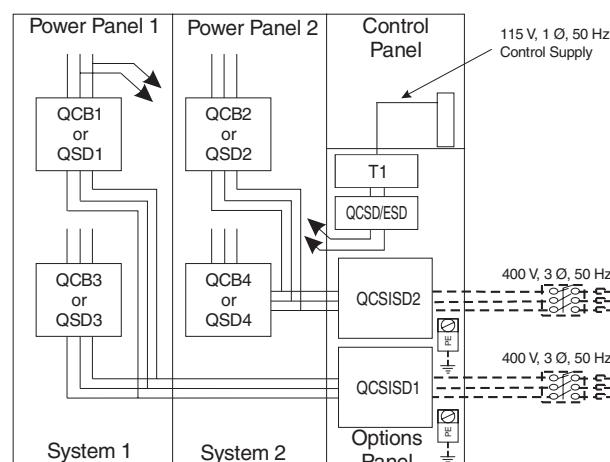

Two field provided 400 V, 3Ø, 50 Hz supplies to the unit with circuit protection. Field connections to factory provided Terminal Blocks (XCSITB) in the Options Panel.

Option 2.2: Internal branch Circuit Breakers (QCB) for each circuit in the two Power Panels.

Option 2.2x: Internal branch Non-Fused Switch Disconnects (QSD) and Fuses for each circuit in the two Power Panels.

The control circuit supply is derived internally from Electrical System 1 (Circuit 1) which then feeds the Non-Fused Switch Disconnect (QCSD/ESD) and Control Transformer (T1) in the Options Panel.

Multi-Point Power Supply Connection - Models 0685 to 1215 with Non-Fused Switch Disconnects (Options 2.3 and 2.3x)

Model YCAS	System 1 Wire Range	System 2 Wire Range	Non-Fused Switch Disconnect Connection
0685	(2) 95-120	35 - 95	
0775	(2) 95-120	25 - 150	
0835	(2) 120 - 240	25 - 150	
0905	(2) 120 - 240	25 - 150	
0965	(2) 120 - 240	25 - 150	
1065	(2) 95-120	(2) 95-120	
1135	(2) 120 - 240	(2) 120 - 240	
1215	(2) 120 - 240	(2) 120 - 240	

Note: Figures in brackets denote the number of available connections per phase.
For example (2) 95 - 120 mm² - can take 2 cables at the stated wire range.

Two field provided 400 V, 3Ø, 50 Hz supplies to the unit with circuit protection. Field connections to factory provided Non-Fused Switch Disconnects (QCSISD) in the Options Panel.

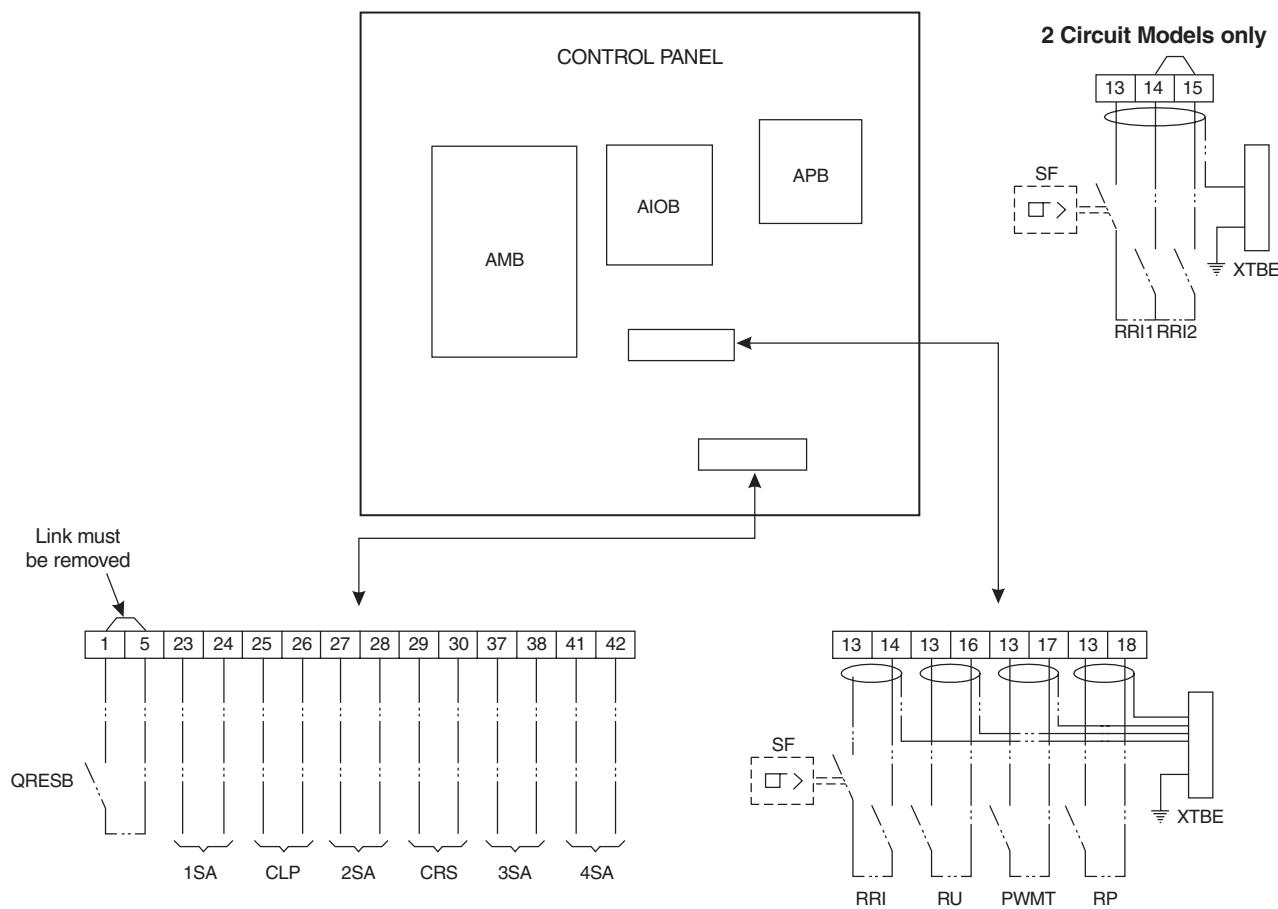

Option 2.3: Internal branch Circuit Breakers (QCB) for each circuit in the two Power Panels.

Option 2.3x: Internal branch Non-Fused Switch Disconnects (QSD) and Fuses for each circuit in the two Power Panels.

The control circuit supply is derived internally from Electrical System 1 (Circuit 1) which then feeds the Non-Fused Switch Disconnect (QCSD/ESD) and Control Transformer (T1) in the Options Panel.
