11 – Optional	91
11.1 – Filters	91
11.2 – HP-FAN	93
11.3 – Reheating and humidity control (optional)	96
11.4 – Humidification and dehumidification system	103
11.5 – Water control valve (models W/H)	104
11.6 – Flooding alarm (Liquistat)	104
11.7 – Smoke alarm (Smokestat)	104
11.8 – Fire alarm (Firestat)	104

11.9 – Fresh air	105
11.10 – Suction and delivery ducts	105
11.11 – Deadening cartridges for delivery channels – Silent Carts (models Over)	106
11.12 – Delivery plenum with horizontal throw (models Over)	107
11.13 – Grid with one deflection rank (models Over)	107
11.14 – Base–frames: models TBD	107
11.15 – Base–modules (models Over)	107
11.16 – Automatic condensate drain pump	107
11.17 – Non–return valve (models A and D)	108
11.18 – Additional temperature and humidity sensor (EEAP)	108
11.19 – Microprocessor control with graphic display HIROMATIC G	108
11.20 – Deadening insulation coating	109
11.21 – Duct with deadening insulation coating	109
11.22 – Power supply at 230/3/50	110
11.23 – Special packing	110
11.24 – Air intake from the bottom (models Over)	110
11.25 – Accessory combination	110
12 – Overall dimensions	111

1 – The serie

HIFLEX is the new series of air conditioners developed by **Liebert HIROSS** to allow maximum flexibility of application in technological environments, from data processing centers to manned control rooms and electronic centers for telecommunication. This series includes units with a rated cooling capacity ranging from 5 to 40 kW.

1.1 – Unit coding

A mark with four alphanumeric characters identifies the model.

4LOA

is the numeric value identifying the size of the unit (4–6–8–)
Models 5–7–9 are double.

M Small type – R22

S Small size – R22

L Large size – R22

P Small size – R407C

G Large size – R407C

U underfloor air flow (Under)

O upward air flow (Over)

C constant

A Direct expansion unit with external air cooled condenser

C Chilled water unit

D Direct expansion unit and chilled water unit (DUALFLUID) with external air cooled condenser

F Direct expansion unit and chilled water unit (FREECOOLER) with water cooled condenser – one water circuit.

H Direct expansion unit and chilled water unit (DUALFLUID) with water cooled condenser

W Direct expansion unit with water cooled condenser

1.2 – Main features and advantages

The air conditioners of HIFLEX series have the following features:

- ✓ High sensible cooling capacity; high EER (Energy Efficiency Ratio)
- ✓ Total front accessibility for the maintenance
- ✓ Low acoustic emission
- ✓ Exact electronic control by microprocessor
- ✓ Small plant dimensions

2 – Configuration

Here is a short description of the peculiar features of each of the six available versions.

2.1 – Version A

Direct expansion air–condensed units

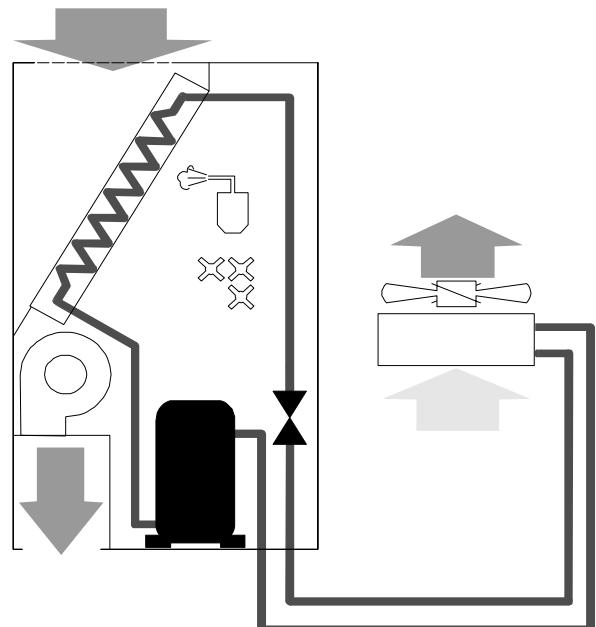

Refrigerating circuit

The 4–6–8 models are provided with a **single refrigerating circuit**, the units 5–7–9 have two refrigerating circuits. The refrigerating circuit includes the compressor and the thermal expansion valve with an external equalizer (or in the M version, the capillary) controlling the refrigerant flow to the evaporator so as to keep a steady overheating degree. Before the thermal expansion valve there is a **sight glass** enabling the visual check of the refrigerant charge. A **dryer filter** is installed in the liquid line for better cleaning and less humidity in the circuit. The welded steel **liquid receiver** is available in the refrigerating circuit to enable the constant and even refrigerant flow to the expansion valve. On–off valves are installed as standard to help the extraordinary maintenance of the circuits.

For a safe operation, during the start–up it is advisable to install the **non–return valve** (supplied as optional on request) on the connection of the refrigerant with the external condenser to protect the compressor from unexpected refrigerant migrations

(see installation diagramme). A suitably sized **safety valve** is installed on the liquid receiver; the valve is equipped with flanged connections to allow the refrigerant to be discharged outside through suitable pipes. All low temperature parts of the refrigerating circuit are insulated. The refrigerating circuit is also provided with a high pressure switch and a low pressure switch. The **low pressure switch** has automatic resetting, whereas – for safety reasons due to possible high pressure in the compressor – the **high pressure switch** has manual resetting. The pressure switch calibration values are shown in the installation manual supplied with the machine.

The units are supplied without the external condenser and with nitrogen–pressed refrigerating circuit. The customer himself has to make the connection with the external condenser and the refrigerant charging. All the instructions for the necessary operations are contained in the installation manual.

External condensing unit

The units are coupled with the **air condensers** of **Liebert HIROSS** wide range in the versions with standard axial fans and with low noise axial fans. For technical data and performances refer to the relevant technical documentation. The following paragraphs describe the suggested couplings for the HIFLEX units as a function of the outdoor air temperature. The data given below are approximate and must always be verified on the basis of the specific performances and working conditions required.

2.2 – Version W

Direct expansion water–condensed units

Refrigerating circuit

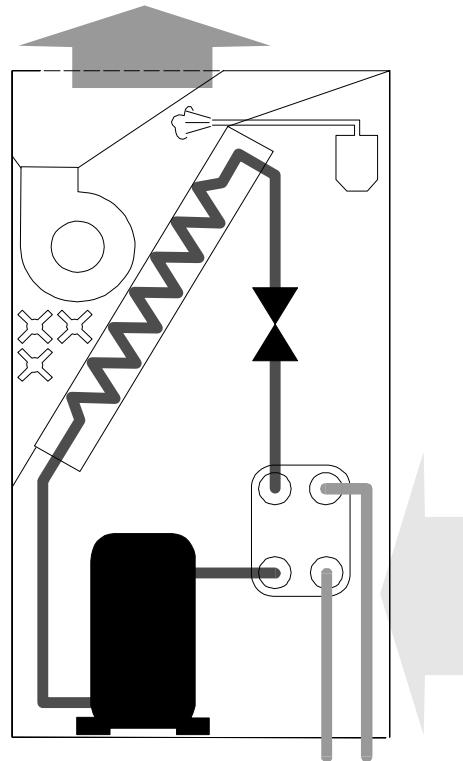

The 4–6–8 models are provided with a **single refrigerating circuit**, the units 5–7–9 have two refrigerating circuits. The refrigerating circuit includes the compressor and the thermal expansion valve with an external equalizer controlling the refrigerant flow to the evaporator so as to keep a steady overheating degree. Before the thermal expansion valve there is a **sight glass** enabling the visual check of the refrigerant charge. A **dryer filter** is installed in the liquid line for better cleaning and less humidity in the circuit. **On–off valves** are installed as standard to help the extraordinary maintenance of the circuits.

A suitably sized **safety valve** is installed after the condenser; the valve is equipped with flanged connections to allow the refrigerant to be discharged outside through suitable pipes. All low temperature parts of the refrigerating circuit are insulated. The refrigerating circuit is also provided with a high pressure switch and a low pressure switch. The **low pressure switch** has automatic resetting, whereas – for safety reasons due to possible high pressure in the compressor – the **high pressure switch** has manual resetting. The pressure switch calibration values are shown in the installation manual supplied with the machine.

Condenser

The units are provided with a built-in stainless steel water condenser with braze-welded plates; this advanced exchanger type gives the highest efficiency in heat exchange. In addition, a certain oversizing of the exchanger has been provided so as to reduce pressure drops (and energy consumption of the water pump) as much as possible and thus to allow the unit to operate with the external chiller in closed circuit, even at high outdoor temperatures.

The units shall operate with **throwaway water**, **tower water** or **water in closed circuit with external chiller**. In the operation with closed circuit, the water is cooled by the outdoor air in a heat exchanger; in this case, to avoid unwanted ice formation during winter, it is advisable to obtain the mixture always with a glycol percentage (refer to the installation manual for the suitable percentages). The circulation of the water-glycol mixture is forced (the pump is not supplied). If throwaway water or tower water is used, when installing the unit fit a **mechanical filter** on the water line to protect the condenser against possible impurities contained in the water (for the condenser cleaning see the installation manual).

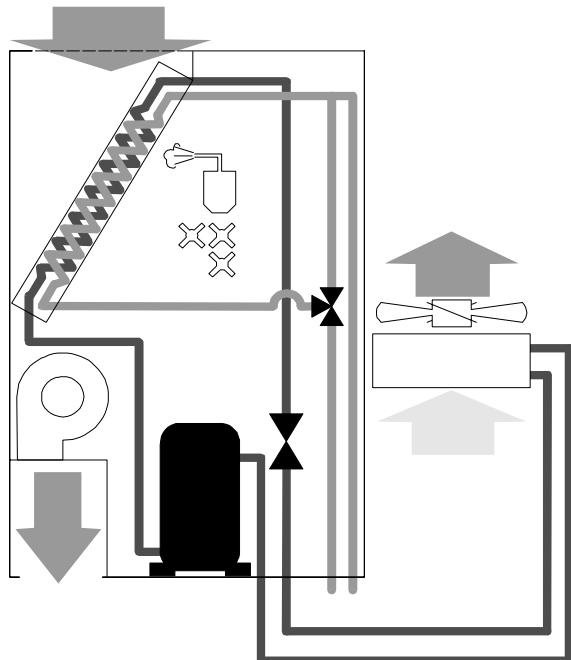

2.3 – Version D

Air-condensed dualfluid units

Refrigerating circuit

The 8 models are provided with a **single refrigerating circuit**, the units 9 have two refrigerating circuits. The refrigerating circuit includes the compressor and the thermal expansion valve with an external equalizer controlling the refrigerant flow to the evaporator so as to keep a steady overheating degree. Before the thermal expansion valve there is a **sight glass** enabling the visual check of the refrigerant charge. A **dryer filter** is installed in the liquid line for better cleaning and less humidity in the circuit. The welded steel **liquid receiver** is available in the refrigerating circuit to enable the constant and even refrigerant flow to the expansion valve. On-off valves are installed as standard to help the extraordinary maintenance of the circuits. For a safe operation, during the start-up it is advisable to install the non-return valve (supplied as optional on request) on the connection of the refrigerant with the external condenser to protect the compressor from unexpected refrigerant migrations (see installation diagramme).

A suitably sized safety valve is installed on the liquid receiver; the valve is equipped with flanged connections to allow the refrigerant to be discharged outside through suitable pipes. All low temperature parts of the refrigerating circuit are insulated. The refrigerating circuit is also provided with a high pressure switch and a low pressure switch. The low pressure switch has automatic resetting, whereas – for safety reasons due to possible high pressure in the compressor – the high pressure switch has manual resetting. The pressure switch calibration values are shown in the installation manual supplied with the machine.

External condensing unit

The units are coupled with the **air condensers** of **Liebert HIROSS** wide range in the versions with standard axial fans and with low noise axial fans. For technical data and performances refer to the relevant technical documentation. The following paragraphs describe the suggested couplings for the HIFLEX units as a function of the outdoor air temperature. The data given follow are approximate and must always be verified on the basis of the specific performances and working conditions required.

Hydraulic circuit

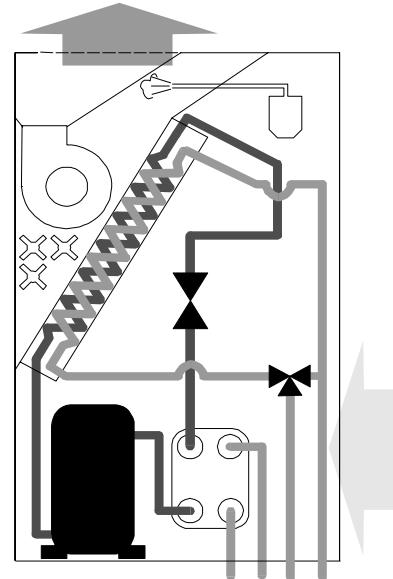

The unit is provided with a **3-way modulating valve**, complete with incremental motor for the water flow control to the coil; the opening or closing signals, generated by the electronic control, adjust the valve in order to keep the ambient temperature at the required value. Through a series of menus it is possible to set all parameters on the control for a correct adjustment, i.e. set-points, proportional bands, proportional or proportional+integral adjustment, integrating factor and valve feature. It is possible to adjust the valve manually in closing position (coil side) by means of a suitable wrench.

2.4 – Version H

Water–condensed dualfluid units

Refrigerating circuit

The 8 models are provided with a **single refrigerating circuit**, the units 9 have two refrigerating circuits. The refrigerating circuit includes the compressor and the thermal expansion valve with an external equalizer controlling the refrigerant flow to the evaporator so as to keep a steady overheating degree. Before the thermal expansion valve there is a **sight glass** enabling the visual check of the refrigerant charge. A **dryer filter** is installed in the liquid line for better cleaning and less humidity in the circuit. **On–off valves** are installed as standard to help the extraordinary maintenance of the circuits. A suitably sized **safety valve** is installed after the condenser; the valve is equipped with flanged connections to allow the refrigerant to be discharged outside through suitable pipes. All low temperature parts of the refrigerating circuit are insulated. The refrigerating circuit is also provided with a high pressure switch and a low pressure switch. The low pressure switch has automatic resetting, whereas – for safety reasons due to possible high pressure in the compressor – the high pressure switch has manual resetting. The pressure switch calibration values are shown in the installation manual supplied with the machine.

Condenser

The units are provided with a built-in stainless steel water condenser with braze-welded plates; this advanced exchanger type gives the highest efficiency in heat exchange. In addition, a certain oversizing of the exchanger has been provided so as to reduce pressure drops (and energy consumption of the water pump) as much as possible and thus to allow the unit to operate with the external chiller in closed circuit, even at high outdoor temperatures.

The units shall operate with **throwaway water**, **tower water** or **water in closed circuit** with external chiller. In the operation with closed circuit, the water is cooled by the outdoor air in a heat exchanger; in this case, to avoid unwanted ice formation during winter, it is advisable to obtain the mixture always with a glycol percentage (refer to the installation manual for the suitable percentages). The circulation of the water–glycol mixture is forced (the pump is not supplied). If throwaway water or tower water is used, when installing the unit fit a **mechanical filter** on the water line to protect the condenser against possible impurities contained in the water (for the condenser cleaning see the installation manual).

Hydraulic circuit

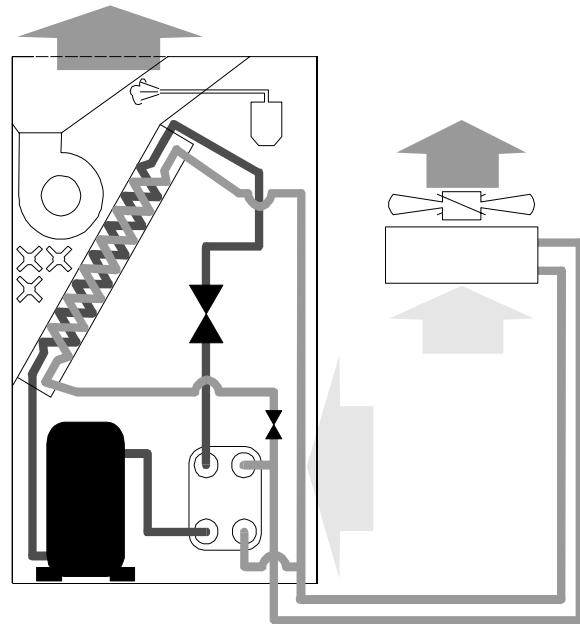

The unit is provided with a **3–way modulating valve**, complete with incremental motor for the water flow control to the coil; the opening or closing signals, generated by the electronic control, adjust the valve in order to keep the ambient temperature at the required value. Through a series of menus it is possible to set all parameters on the control for a correct adjustment, i.e. set-points, proportional bands, proportional or proportional+integral adjustment, integrating factor and valve feature. It is possible to adjust the valve manually in closing position (coil side) by means of a suitable wrench.

2.5 – Version F

Freecooler units

Refrigerating circuit

The 8 models are provided with a **single refrigerating circuit**, the units 9 have two refrigerating circuits. The refrigerating circuit includes the compressor and the thermal expansion valve with an external equalizer controlling the refrigerant flow to the evaporator so as to keep a steady overheating degree. Before the thermal expansion valve there is a **sight glass** enabling the visual check of the refrigerant charge. A **dryer filter** is installed in the liquid line for better cleaning and less humidity in the circuit. **On-off valves** are installed as standard to help the extraordinary maintenance of the circuits. A suitably sized **safety valve** is installed after the condenser; the valve is equipped with flanged connections to allow the refrigerant to be discharged outside through suitable pipes. All low temperature parts of the refrigerating circuit are insulated. The refrigerating circuit is also provided with a high pressure switch and a low pressure switch. Il pressostato di minima è a riammoto automatico, mentre, per ragioni di sicurezza derivanti dalle possibili alte pressioni nel compressore, il pressostato di massima è dotato di riammoto manuale. I valori di taratura dei pressostati sono indicati nel manuale di installazione, fornito a bordo macchina.

The low pressure switch has automatic resetting, whereas – for safety reasons due to possible high pressure in the compressor – the high pressure switch has manual resetting. The pressure switch calibration values are shown in the installation manual supplied with the machine.

Condenser

The units are provided with built-in stainless steel water condensers with braze-welded plates; this advanced exchanger type gives the highest efficiency in heat exchange. In addition, a certain oversizing of the exchanger has been provided so as to reduce pressure drops (and energy consumption of the water pump) as much as possible and thus to allow the unit to operate with the external chiller in closed circuit, even at high outdoor temperatures. The units shall operate with **water in closed circuit** with external chiller. In the operation with closed circuit, the water is cooled by the outdoor air in a heat exchanger; in this case, to avoid unwanted ice formation during winter, it is advisable to obtain the mixture always with a glycol percentage (refer to the installation manual for the suitable percentages). The circulation of the water-glycol mixture is forced (the pump is not supplied). To minimize water consumption and the condensing pressure check during the different seasons of the year, the unit is provided with a water register supplied as standard on the machine.

Hydraulic circuit

The unit is provided with a **2-way modulating valve**, complete with incremental motor for the water flow control to the freecooling coil; the opening or closing signals, generated by the electronic control, manage the valve in order to keep the ambient temperature at the required value.

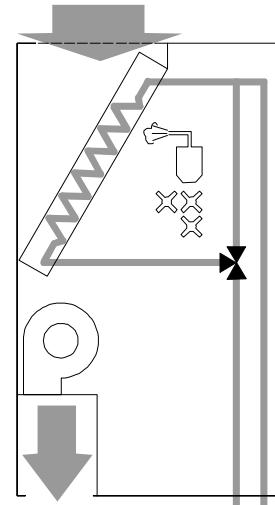

2.6 – Version C

Chilled water units

Hydraulic circuit

Each unit is provided with one hydraulic circuit. The unit is provided with a **3-way modulating valve**, complete with incremental motor for the water flow control to the coil; the opening or closing signals, generated by the electronic control, manage the valve in order to keep the ambient temperature at the required value.

Through a series of menus it is possible to set all parameters on the control for a correct adjustment, i.e. set-points, proportional bands, proportional or proportional+integral adjustment, integrating factor and valve feature. It is possible to adjust the valve manually in closing position (coil side) by means of a suitable wrench.

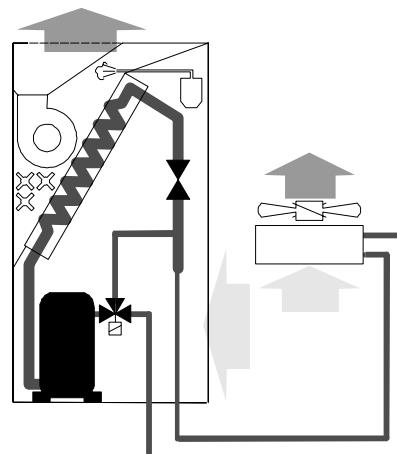

2.7 – Hiflex Constant versione A

Direct expansion air–condensed units with high precision control

Refrigerating circuit

Each unit is provided with a **single refrigerating circuit**. This is similar to the version's refrigerant circuit (see para. 2.1), but a modulating hot gas bypass valve is present. This valve permits high precision evaporating temperature regulation.

For other characteristics, see para. 2.1.

2.8 – Hiflex Constant versione W

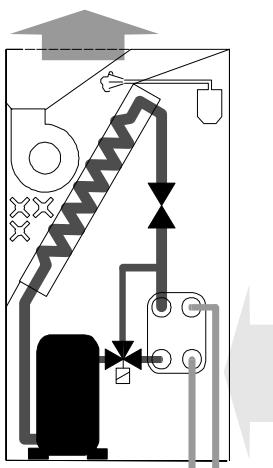

Direct expansion water–condensed unit with high precision control

Refrigerating circuit

Each unit is provided with a **single refrigerating circuit**. This is similar to the version's refrigerant circuit (see para. 2.2), but a modulating hot gas bypass valve is present. This valve permits high precision evaporating temperature regulation.

For other characteristics, see para. 2.2.

Here is a summary list of the peculiar features of the different versions:

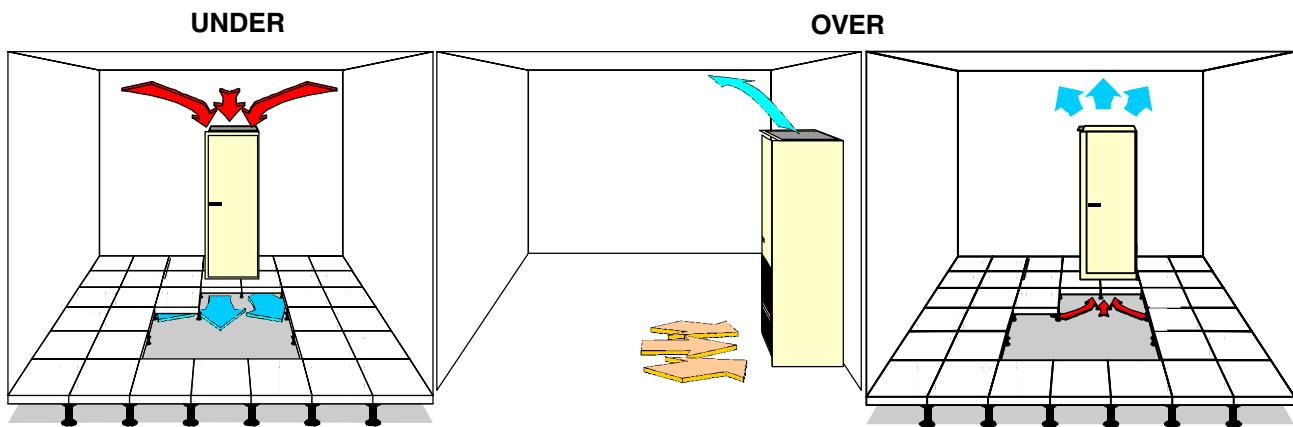

Here is a summary list of the peculiar features of the different versions:

	Heat exchange	Refrigerating circuit	Installation
A	The unit cools the air by an air/refrigerant coil (direct expansion). The refrigerating circuit condenser is externally mounted, air-cooled.	The refrigerating circuits are not pre-charged with refrigerant. There is a liquid receiver on which the safety valve is installed. The Constant units are equipped with hot gas by-pass valve.	The unit must be connected to the external condenser and the refrigerant must be charged.
W	The unit cools the air by an air/refrigerant coil (direct expansion). The refrigerating circuit plate condenser is indoor, cooled by a water flow.	The refrigerating circuits are pre-charged with refrigerant. The safety valve is installed downstream the condenser. The Constant units are equipped with hot gas by-pass valve.	The unit must be connected to the piping of the cooling water of the water/refrigerant condenser.
D	The dualfluid unit cools the air flow by means of an air/refrigerant coil (direct expansion) or, as an alternative, an air/water coil. The refrigerating circuit condenser is externally mounted, air-cooled.	The refrigerating circuits are not pre-charged with refrigerant. There is a liquid receiver on which the safety valve is installed.	It is necessary to connect the unit to the external condenser, to charge it with refrigerant and to connect the chilled water piping for the air/water coil.
H	The dualfluid unit cools the air flow by means of an air/refrigerant coil (direct expansion) or, as an alternative, an air/water coil. The refrigerating circuit plate condenser is indoor, cooled by a water flow.	The refrigerating circuits are pre-charged with refrigerant. The safety valve is installed downstream the condenser.	The unit must be connected to the chilled water piping for the air/water coil and to the cooling water piping of the water/refrigerant condenser.
F	The freecooler unit cools the air flow by means of an air/refrigerant coil (direct expansion) or, as an alternative, an air/water coil. The water flow is cooled by an external rad-cooler. When the external temperature is higher than the ZET, the water exchanges heat with the refrigerant in the internal water/refrigerant plate condenser. When the external temperature is lower than the ZET, the water is cooled as much as sufficiently to cool the air directly in the air/water coil.	The refrigerating circuits are pre-charged with refrigerant. The safety valve is installed downstream the condenser.	The unit must be connected to the closed water circuit with the rad-cooler.
C	The unit cools the air flow by an air/water coil.	The unit has no refrigerating circuit.	The unit must be connected to the chilled water piping.

2.9 – Air control

All units are available in the three configurations shown below. The **Hiflex Constant** units are supply with upward air flow (Over) only.

2.10 – Dimensions and accessibility

The unit structures are made in three sizes with the following dimensions:

	W	D	H
Size 4:	750	450	1950
Size 6:	750	600	1950
Size 8:	750	750	1950
Size 5:	1490	450	1950
Size 7:	1490	600	1950
Size 9:	1490	750	1950

Ordinary and special maintenance is easier thanks to the front access enabling the replacement of the air filters, the intervention on the components of the refrigerating circuit – such as compressor, liquid receiver, thermal expansion valve, refrigerant sight glass, drying filter – or on the fan, the humidifier, the electric board, the electronic control, the electric heating elements.

The refrigerant, electric and hydraulic connections are placed on the lower part of the unit.

3 – Operating limits

All versions

HIFLEX units are provided for operating within the following working ranges (the limits concern new units on which correct installation and maintenance have already been made):

Ambient conditions:

from 18.0°C, 45% R.H. to 27.0°C, 55% R.H.

To avoid the formation of too much condensate which might cause water drops entrainment, it is important to check that the latent capacity – difference between total and sensible load at the selected conditions doesn't exceed the value of 5.5 kW.

Air flow

The minimum and maximum values are shown in the tables of the useful available heads. However, safety devices are provided as standard to protect the various components from any damages due to operation outside the indicated limits.

Power tolerances

Standard voltage (V): ± 10%

Standard frequency (Hz): ± 2

Versions A and D

Outdoor conditions:

low limit = +10°C (from +9°C to –20°C with Variex accessory installed on the condenser)

high limit determined by the size of the coupled condenser. Exceeding these limits causes the compressor lock due to the safety pressure switch, which can be restored only by hand.

Condensing unit installation:

Maximum distance between ambient unit and external air condenser: 30 m (equivalent length).

Max. geodetic height difference between condenser and unit: 3 m (if the condenser is placed underneath the ambient unit).

Attenzione:

I ventilatori centrifughi dispongono di prevalenza pari a quella nominale di progetto. Se le perdite di carico del condotto di espulsione sono esigue (condotto molto corto o sovrdimensionato) la corrente assorbita dal motore può superare il valore di targa del motore. In questi casi è assolutamente necessario attenersi ad una delle seguenti istruzioni:

- 1) Introdurre nel circuito delle perdite di carico supplementari (inserendo nel condotto una serranda manuale o una tagliola).
- 2) Ridurre il numero di giri del ventilatore ovunque sia possibile, ossia quando il ventilatore è accoppiato mediante cinghie al motore oppure quando è dotato di motore monofase a più velocità.

N.B.: L'operazione può considerarsi definitiva quando l'assorbimento del ventilatore sarà prudenzialmente inferiore al valore di targa di almeno il 10%.

4 – Component features

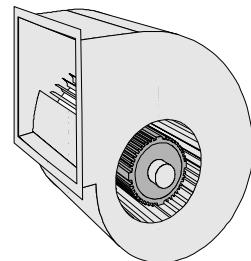

4.1 – Fan

Double section, galvanized steel, centrifugal fan, forward blades.

High efficiency.

The motor is single-phase; provided with internal thermal protection.

The fan wheel is statically and dynamically balanced; the bearings are self-lubricating.

4.2 – Compressor

SCROLL compressors

High COP (Coefficient Of Performance)

High MTBF (Minimum Time Between Failures)

Low sound level.

Vibration-damped.

Provided with internal thermal protection.

Low pickup current (equalization of the internal pressures).

4.3 – Coils

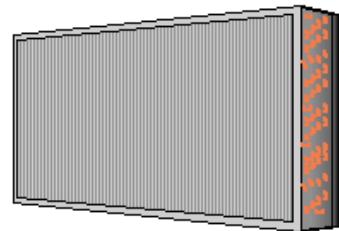

High front surface.

Made of copper pipes and aluminium fins.

Fins treated with hydrofile styrol acrylic paints to withstand corrosive atmospheres.

Low pressure drop.

High SHR (Sensible Heat Ratio).

4.4 – Frame and panels

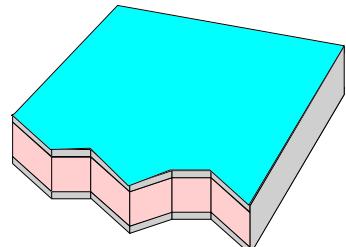

The sheet steel structure, painted with RAL 7035 epoxy-polyester powders, is assembled by stainless steel screws; the paneling system ensures higher stiffness; there will also be some pluggings (compressor space and fan) for guaranteeing both safety and high acoustic absorption.

The electric board protecting panel is assembled on hinges to make the access easier; this can be opened by the fast closing lock. The side panels are screwed to the supports. The rear panel is screwed directly to the frame.

The air returns from the machine top in machines with underfloor air delivery, whereas in machines with upward air delivery it returns through the metal grid on the front panel.

The compressor is housed in a closed space in the lower part of the unit and is completely insulated against the air flow. The compressor section can be reached even during the unit operation by removing the front panel and the protection plugging.

The panels are lined with thermoacoustic insulating material – class 1.

4.5 – Filters

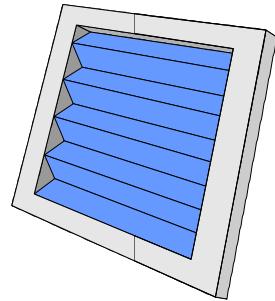

Removable filters.

The guaranteed efficiency degree is from G3 and F9 (CEN EN 779, corresponding to EU3 and EU9 according to Eurovent EU4/5).

The folded structure of the filters gives high filtration efficiency and low pressure drop.

The filter media used consists of synthetic fibre cells. The frame is made of cardboard.

Pre-filtration system for Over models.

4.6 – Refrigerants

The units are designed for being used with refrigerant R22 or, as optional, R407C.

4.7 – Electric board

The electric board is housed in the front part in a space insulated against the air flow and protected by a plastic crankcase, so as to avoid tampering by non-authorized personnel and to protect the electric board parts supplied with a voltage higher than 24 V.

The electric board complies with the norm 204–1 IEC.

The air conditioners have been provided for operating at 400 V~/3/50 Hz+N+G (as special alternative execution, the version with 220~/V/3/50Hz + G can be supplied) and at 380 V~/3/60 Hz+N+G and 230 ~/3/60 Hz+G.

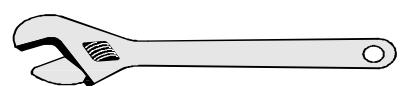

Magnetothermal switches are supplied as protection of every electric component.

A single-phase transformer has been provided for supplying power to the secondary circuit at 24 V. A main switch with door-locking handle is installed in series on the safety crankcase to prevent it from being removed when the switch is in the operating position.

There will be an automatic start-up after a possible stop due to power supply lack.

Additional terminals for remote start-up and carry of some operating conditions (fans and compressors) or connection of additional devices (Liquistat, Firestat, Smokestat, clogged filters) are set in series on the terminal board of the electric board. On the terminal board there is also a clean contact for the remote signalling of the general alarm.

4.8 – Accessibility

Having access to the compressor is possible even when the unit is operating by removing the front panel. The access to the fan is executed with the greatest care for easier interventions (maintenance and/or fan replacement).

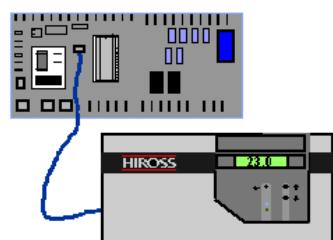

4.9 – Control system

Very simple user interface.

Immediately intelligible utilization of the control unit system with LCD.

Net connectivity of several units.

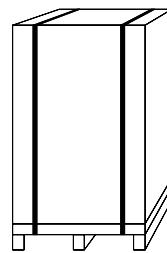

Possible utilization of the Hiromatic graphic terminal.

4.10 – Packing

The air conditioners are usually packed in wooden pallets and carton boxes. An air bubble plastic film protects the painted surfaces.

On request,
wooden crates or cases can be supplied for the sea transport.

4.11 – Product quality and safety

The product conforms to European Union directives 98/37/CE (89/392/CEE; 91/368/CEE; 93/68/CEE), 89/336/CEE; 73/23/CEE; 97/23/EC.

Further, the Company Quality System of Air Conditioning Division is approved by LRQA according to the standards UNI EN ISO 9001: 2000 and the product is the result of activities performed in compliance with the provisions contained in the Quality procedures and plans.

The unit is supplied complete with a test certificate and conformity declaration and control component list.

The units of the Hiflex series are marked as they comply with the European directives concerning mechanical, electrical, electromagnetic and pressure equipment safety.

Il Sistema Garanzia Qualità
della Divisione A/C Conditioning
è certificato da Lloyd's Register
Quality Assurance conforme
alla norma ISO 9001:1994.

5 – Condensing section

5.1 – Air condensers

The units may be connected to a wide range of our condensers single circuit (HCA) or double circuit (HBA).

The following paragraphs describe the suggested coupling for **Hiflex** units as a function of the outdoor air temperature. The data given below are approximate and must always be verified on the basis of the specific performances and different operating conditions.

Standard Model	Performances			Electric data			Overall dimensions		
	Duty (d) kW	Air flow m³/h	SPL 5 m dB(A)	Supply V/ph/Hz	Number of fans n°	Total absorbed power kW	Width mm	Depth mm	Height (c) mm
HCA07	7.1	1900	44	230/1/50(⁰)	1	0.18	803	451	703
HCA10	9.4	4100	47	230/1/50(⁰)	2	0.36	1253	451	703
HCA14	14.5	4430	44	230/1/50(⁰)	1	0.29	1175	797	890

The coupling applies for a total equivalent distance of max. 30 m and in compliance with the instructions for the unit installation.
Max. geodetic height difference between condenser and unit: 3 m (if the condenser is placed underneath the ambient unit).

5.2 – Water condensers.

The water-condensed units are provided with a water/refrigerant exchanger with braze-welded **plates** made of **stainless steel**; this advanced exchanger type gives the highest efficiency in heat exchange. In addition, a certain oversizing of the exchanger has been provided so as to reduce pressure drops (and energy consumption of the water pump) as much as possible and thus to allow the unit to operate with the external chiller in closed circuit, even at high outdoor temperatures.

The O/UW units are designed for operating with mains water, tower water or water in closed circuit with an external chiller. When operating in a closed circuit, the water is cooled by the outdoor air in a heat exchanger; in this case, to avoid unwanted ice formation during winter, it is advisable to use a water/glycol mixture. The circulation of the water-glycol mixture is forced (the pump is not supplied). If mains water or tower water is used, when installing the unit fit a mechanical filter on the water line to protect the condenser against possible impurities contained in the water (for condenser cleaning see the installation manual).

5.3 – Dry coolers

Our dry-coolers are built with a copper/aluminium cooling coil and axial fan(s).

The main data on dry coolers is shown in the following table:

Standard Model	Performances			Electric data			Overall dimensions		
	Duty (a)	Air flow	SPL 10 m	Supply	Number of fans	Total absorbed power	Width	Depth	Height (b)

6 – Technical remarks

6.1 – Fluid, R407C

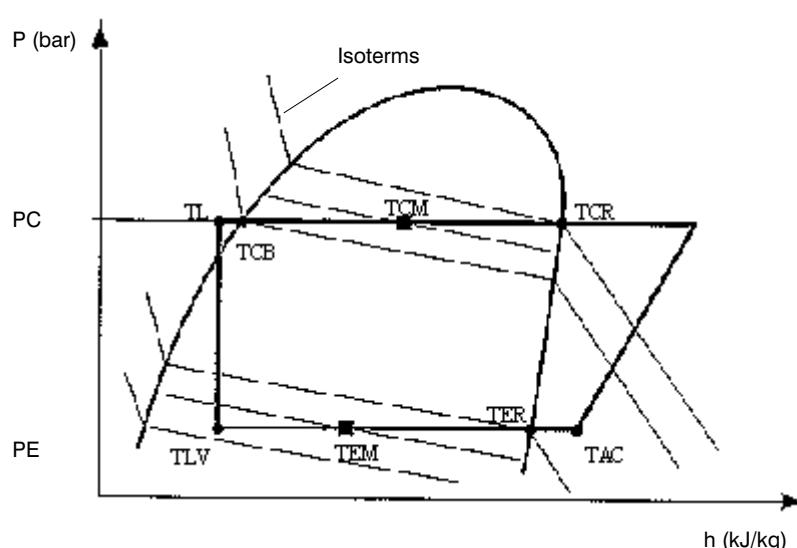

Recent international agreements (Montreal, London, Copenhagen, Vienna and San José) have abolished – with precise expiry dates – the production of the HCFC fluids (e.g.: R22) considered as harmful for the ozone layer. The new HFC fluids (hydrofluorocarbons) which have to replace them contain no chlorine, a dangerous substance for the ozone layer. The refrigerant R407C replace the fluid R22.

Its main features are:

- ✓ Non-azeotropic mixture made of R32/R125/R134a in which the percentage weight composition is, in ratio, 23/25/52.
- ✓ Thermophysical features similar to R22.
- ✓ ODP (Ozone Depletion Potential) equal to 0.
- ✓ Not flammable in the air.
- ✓ Low toxicity degree.

The new HFC fluids are essentially incompatible with the mineral oils which are usually used with the fluids R12 and R22.

Therefore, new synthetic lubricants based on polyester molecules have been developed for their use.
Note: considering the peculiar thermophysical features of the fluid we give the description of the refrigerating cycle shown in the phase diagram of the R407C.

High pressure side

TCB: condensation temperature bubble point (Liquid)

TCR: condensation temperature dew point (Vapor)

TCM: average condensation temperature $(TCB+TCR)/2$

TL: temperature of the refrigerant at the expansion valve inlet

Overheating = TAC – TER

Low pressure side

TLV: liquid–steam temperature

TER: evaporation temperature dew point (Vapor)

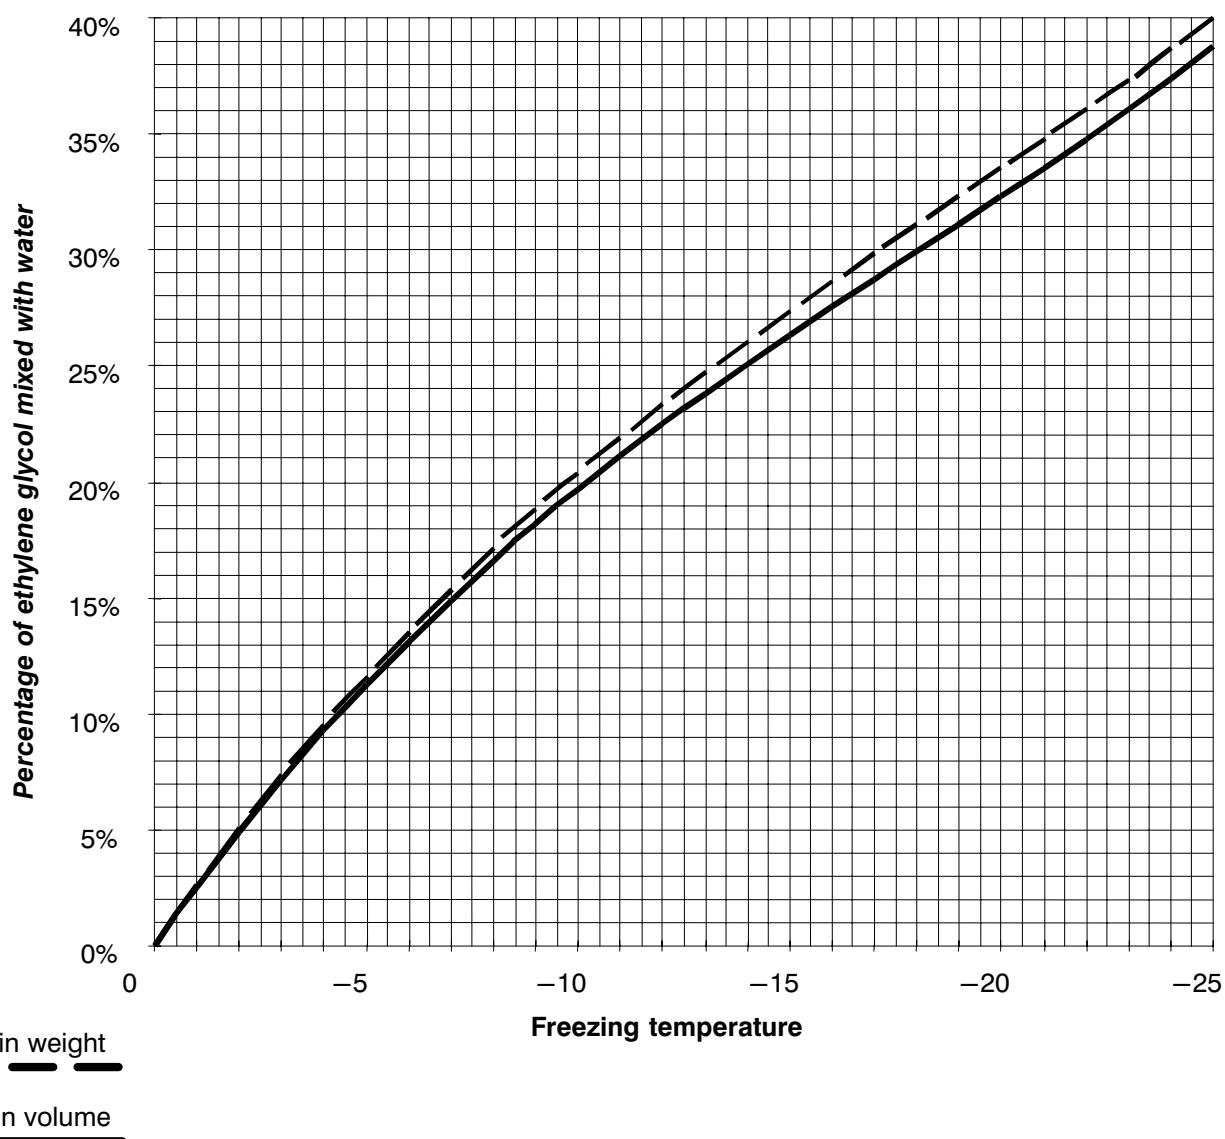

TEM: average evaporation temperature $(TLV+TER)/2$

TAC: temperature of the refrigerant at the compressor inlet

Sub-cooling = TCB – TL

Attention

The differences between the units operating with the fluid R407C and those operating with the fluid R22 are described below.

- 1) Fan OA is for standard unit operating at the standard pressure drop.
- 2) Compressor OA is referred to – room conditions: 24°C, 50% RH; condensing temperature: 45°C. A/W/D/H models
- 3) Compressor OA is referred to – room conditions: 24°C, 50% RH; ext. temperature: 35°C. F models
- 4) Compressor FLA is for the contemporary conditions of minimum evaporating pressure and maximum condensing pressures.

1) Fan OA is for standard unit operating at the standard pressure drop.

2) Compressor OA is referred to – room conditions: 24°C, 50% RH; condensing temperature: 45°C. A/W/D/H models

3) Compressor OA is referred to – room conditions: 24°C, 50% RH; ext. temperature: 35°C. F models

4) Compressor FLA is for the contemporary conditions of minimum evaporating pressure and maximum condensing pressure.

Fan OA is for standard unit operating at the standard pressure drop.

8 – Aeraulic features

8.1 – Useful available heads

The air conditioners of the Hiflex series are supplied with electric fans sized for a useful head of 20 Pa for the models under, 50 Pa for the models over.

When the pressure drop on the air side are higher or some ducts are provided on the air circuit, the air flows vary as shown below.

The boldface numbers refer to the rated value.

Available heads – 50 Hz

The static pressure increase at the different air flows is indicated hereinafter for a proper calculation of the required useful head. This increase must be taken into account if some optional devices are supplied.

9 – Sound Pressure Level

Hiflex units have been designed with particular care for sound and vibration problems. The complete mechanical insulation of the ventilating section, combined with the special study of the aerdraulic circuit as a consequence of accurate researches made in our thermodynamical laboratories and the oversizing of the components crossed by air offer the highest ventilation efficiency with the lowest sound emission.

9.1 – Sound emission spectra

The following tables show the noise levels for every octave band frequency.

Version UNDER – 50 Hz

Model	Mode	octave band frequency (Hz)									Sound Level [dB(A)]

NOTES:

- (1) Only ventilation (20 Pa back pressure), 2 m in front of the unit and 1 m height, in free field conditions.
- (2) Working compressor (20 Pa back pressure), 2 m in front of the unit and 1 m height, in free field conditions.
- (3) Working compressor, on air delivery.
- (4) Only ventilation, on air delivery.

The sound pressure levels for each octave band are expressed in dB with tolerances of (-0/+2) dB.

Version UNDER – 60 HZ

NOTES:

- (1) Only ventilation (20 Pa back pressure), 2 m in front of the unit and 1 m height, in free field conditions.
- (2) Working compressor (20 Pa back pressure), 2 m in front of the unit and 1 m height, in free field conditions.
- (3) Working compressor, on air delivery.
- (4) Only ventilation, on air delivery.

The sound pressure levels for each octave band are expressed in dB with tolerances of (-0/+2) dB.

10 – Technical data and performances

Technical data and performances – air condensation – xxUA series, downward flow – 50Hz

1 ON THE FOLLOWING STANDARD CONDITIONS: standard supply [voltage $\pm 10\%$]; room conditions 24°C bs; 50% R.H. (17°C bu) – condensation temperature: 45°C

2 Measured in the front part at 1 m height, 2 m distance, referred to free field, with working fans and compressor.

ATTENTION: the refrigerating outputs are meant after deduction of the heat taken from the fans, which must thus be added to the room load. The EER refers only to the room unit. The unit air flow refers in standard configuration with clean class filter G3. The standard diameters of the pipings are valid only for lengths – between the conditioner and the condensing unit – up to 30 equivalent m.

Technical data and performances – air condensation – xxUA series, downward flow – 50Hz

The unit air flow refers in standard configuration with clean class filter G3. The standard diameters of the pipings are valid only for lengths – between the conditioner and the condensing unit – up to 30 equivalent m.

Technical data and performances – air condensation – xxUA series, downward flow – 50Hz

1 ON THE FOLLOWING STANDARD CONDITIONS: standard supply [voltage $\pm 10\%$]; room conditions 24°C bs; 50% R.H. (17°C bu) – condensation temperature: 45°C

2 Measured in the front part at 1 m height, 2 m distance, referred to free field, with working fans and compressor.

ATTENTION: the refrigerating outputs are meant after deduction of the heat taken from the fans, which must thus be added to the room load. The EER refers only to the room unit. The unit air flow refers in standard configuration with clean class filter G3. The standard diameters of the pipings are valid only for lengths – between the conditioner and the condensing unit – up to 30 equivalent m.

Technical data and performances – air condensation – xxUA series, downward flow – 60Hz

1 ON THE FOLLOWING STANDARD CONDITIONS: standard supply [voltage $\pm 10\%$]; room conditions 24°C bs; 50% R.H. (17°C bu) – condensation temperature: 45°C

2 Measured in the front part at 1 m height, 2 m distance, referred to free field, with working fans and compressor.

ATTENTION: the refrigerating outputs are meant after deduction of the heat taken from the fans, which must thus be added to the room load. The EER refers only to the room unit. The unit air flow refers in standard configuration with clean class filter G3. The standard diameters of the pipings are valid only for lengths – between the conditioner and the condensing unit – up to 30 equivalent m.

Technical data and performances – air condensation–xxOA series, upward flow – 60Hz

1 ON THE FOLLOWING STANDARD CONDITIONS: standard supply [voltage ± 10%]; room conditions 24°C bs; 50% R.H. (17°C bu) – condensation temperature: 45°C

2 Measured in the front part at 1 m height, 2 m distance, referred to free field, with working fans and compressor.

ATTENTION: the refrigerating outputs are meant after deduction of the heat taken from the fans, which must thus be added to the room load. The EER refers only to the room unit. The unit air flow refers in standard configuration with clean class filter G3. The standard diameters of the pipings are valid only for lengths – between the conditioner and the condensing unit – up to 30 equivalent m.

Technical data and performances – air condensation – xxCA series, upward flow – 60Hz

1 ON THE FOLLOWING STANDARD CONDITIONS: standard supply [voltage ± 10%]; room conditions 24°C bs; 50% R.H. (17°C bu)

2 Measured in the front part at 1 m height, 2 m distance, referred to free field, with working fans and compressor.

ATTENTION: the refrigerating outputs are meant after deduction of the heat taken from the fans, which must thus be added to the room load. The EER refers only to the room unit. The unit air flow refers in standard configuration with clean class filter G3.

Technical data and performances—water condensation —xxUW series, downward flow—60Hz

1 ON THE FOLLOWING STANDARD CONDITIONS: standard supply [voltage $\pm 10\%$]; room conditions 24°C bs; 50% R.H. (17°C bu)

2 Measured in the front part at 1 m height, 2 m distance, referred to free field, with working fans and compressor.

ATTENTION: the refrigerating outputs are meant after deduction of the heat taken from the fans, which must thus be added to the room load. The EER refers only to the room unit. The unit air flow refers in standard configuration with clean class filter G3.

Technical data and performances—water condensation —xxOW series, upward flow—50Hz

1 ON THE FOLLOWING STANDARD CONDITIONS: standard supply [voltage $\pm 10\%$]; room conditions 24°C bs; 50% R.H. (17°C bu)

2 Measured in the front part at 1 m height, 2 m distance, referred to free field, with working fans and compressor.

ATTENTION: the refrigerating outputs are meant after deduction of the heat taken from the fans, which must thus be added to the room load. The EER refers only to the room unit. The unit air flow refers in standard configuration with clean class filter G3.

Technical data and performances—water condensation –xxOW series, downward flow—50Hz

1 ON THE FOLLOWING STANDARD CONDITIONS: standard supply [voltage $\pm 10\%$]; room conditions 24°C bs; 50% R.H. (17°C bu)

2 Measured in the front part at 1 m height, 2 m distance, referred to free field, with working fans and compressor.

ATTENTION: the refrigerating outputs are meant after deduction of the heat taken from the fans, which must thus be added to the room load. The EER refers only to the room unit. The unit air flow refers in standard configuration with clean class filter G3.

Technical data and performances—water condensation –xxCW series, upward flow—50Hz

AT THE FOLLOWING STANDARD CONDITIONS:

- 1 standard supply [voltage ± 10%]; ambient conditions 24°C bs; 50% R.H.(17°C bu); condensation temperature: 45°C
- 2 Measured at 1 m height and 2 m front distance, in free field, with working fans and compressor.
- 3 Measured at 1 m height and 2 m front distance, in free field, with working fans only.

The cooling capacities are meant after deduction of the heat taken from the fans. Therefore the heat must be added to the ambient load. EER refers to the ambient unit only. The air flow of the units refers to the standard configuration with filter of the G3 class. The standard diameters of the pipes only apply for lengths – between the air conditioner and the condensing unit – up to 30 equivalent m.

Technical data and performances – dualfluid – water condensation – xxU/OH series – 50Hz

AT THE FOLLOWING STANDARD CONDITIONS:

1 standard supply [voltage $\pm 10\%$]; ambient conditions 24°C bs; 50% R.H. (17°C bu); external temperature = 35°C

2 Measured at 1 m height and 2 m front distance, in free field, with working fans and compressor.

3 Measured at 1 m height and 2 m front distance, in free field, with working fans only.

4 ZET: Is the outdoor air temperature value ...

The cooling capacities are meant after deduction of the heat taken from the fans. Therefore the heat must be added to the ambient load. EER refers to the ambient unit only. The air flow of the units refers to the standard configuration with filter of the G3 class. The standard diameters of the pipes only apply for lengths – between the air conditioner and the condensing unit – up to 30 equivalent m.

Technical data and performances – freecooler –xxU/OH series –60Hz

11 – Optional

11.1 – Filters

High efficiency filters G4 and F5, height 100 mm

The high efficiency (optional) filters, of the folded type, 100 mm height, interchangeable with the standard series, can be supplied in the two filtering classes G4 and F5 based on EN 779 (equivalent to European norms Eurovent 4/5).

These filters have a filtering power higher than the standard ones with a higher load loss.

Features of the high efficiency filters

Filtering class	G4	F5
Spare part codes		
Models 4–5	[no.]	210144
Models 6–7 under	[no.]	210149
Models 8–9 under	[no.]	210149
Models 6–7 over	[no.]	210147
Models 8–9 over	[no.]	210148
Height	100	100

High efficiency filters F6, F7 and F9, height 290 mm

The (optional) high efficiency filters, filtering class F6, F7 and F9 according to EN 779 (equivalent to European norms Eurovent 4/5), are made of fiber glass filtering materials. The filtering "V"-section plates with a solid peripheral frame can bear considerable pressure and flow changes.

Features of the high efficiency filters

Filtering class	F6	F7	F9
Spare part codes			
Models 4–5	[no.]	482740	482741
Models 6–7	[no.]	482743	482744
Models 8–9	[no.]	482746	482747
Height	mm	290	290

Filter-holding duct

If filters with 290 mm height are required, a metal duct of the same colour (RAL7032) as the unit must be supplied as filter support to be installed on the machine top.

Models	4	6	8	5	7	9
Length mm	750	750	750	1490	1490	1490
Depth mm	450	600	750	450	600	750

Clogged filter alarm

A differential flow indicator, that can be calibrated, may be installed to inform the microprocessor control about the need to replace the filters when they are clogged.

Additional pressure drop (Pa)

The pressure drop described in the following tables must be subtracted from the heads given in the Useful available head tables of section "Aeraulic features".

11.2 – HP–FAN

When high head values are necessary, the machines can be equipped with HP–FAN optional fans, replacing the standard fans.

By these fans it is possible to adjust the aerdraulic performance (air delivery and head) from a max. to a min. value, through a potentiometer for the models 4–6–8, and through a setting by the Microface control for the models 5–7–9.

This feature enables an accurate calibration in the range of the working point required by the unit.

The operating tables for the optional fans mounted in the units, and adjusted at the highest speed with units equipped with G3 class clean filter follow here below.

The HP–FAN option is available for all the Hiflex models, except 4 MUA and 4 MOA.

Available static pressure at max speed –50 Hz

11.3 – Reheating and humidity control (optional)

Electrical heating (and dehumidification system)

The electrical heaters can largely keep the correct temperature with dry bulb. The elements are made of aluminum with high efficiency fins to keep a low power density on the surfaces. The ionization effects are removed thanks to the low surface temperature of the elements.

The stages of the electrical heaters are distributed on the 3 phases to avoid balancing problems.

There are three steps, two contactors, temperature electronic control of the ON–OFF type, safety thermostat with manual reset, magnetothermal switch against short circuits, harness protection against possible casual contacts.

When the electrical heating is installed, the dehumidification system is operating as well, and the relevant humidity sensor and indicator are provided (see "Humidification and dehumidification system" for the dehumidification function).

It is possible to install the electric heating matched with the hot gas or hot water reheating. In this case, refer to the paragraph "Hot gas reheating" or "Hot water heating".

Heating capacity (400V/3ph/50Hz)

Models	4	6	8	5	7	9
3 steps, total power [kW]	4.5	4.5	4.5	9.0	9.0	9.0
2 steps [kW]	3.0	3.0	3.0	6.0	6.0	6.0
1 step [kW]	1.5	1.5	1.5	3.0	3.0	3.0

Hot gas reheating (and A/W/D/F/H unit optional dehumidification system)

Hiflex can be supplied with a reheating system using the heat that is normally sent to the condenser to heat the air, saving energy. This system is activated during dehumidification (in fact, the relevant humidity sensors and indicators are provided) when the temperature decreases under the set value: in this way no additional energy is required for the reheating.

A control valve prevents the refrigerant from flowing into the reheating coil when this is not required. The hot gas reheating is available as an alternative to the hot water heating. For the "Constant" unit the hot gas system is of series, the hot water system is not available.

Operation mode of the electrical heating and the hot gas reheating

Deumidification function							
first steep				second steep			
ON	OFF			ON		OFF	
hot gas reheating	electric heating 1 st power step		hot gas reheating + 2 power step electric heating		electric heating 3 rd power step

Hot water heating (and dehumidification system)

The hot water heating coil made of copper pipes and aluminum fins, single row, testing pressure 30 bar, includes an exhaust valve. A three-way on-off valve is supplied as standard. It is directly controlled by a microprocessor as a function of the room temperature and by a hot water thermostat (to be supplied by the customer).

When the hot water heating is installed, the dehumidification system is operating as well and the relevant humidity sensor and indicator are provided (see "Humidification and dehumidification system" for the dehumidification function).

The hot water heating system is an alternative to the hot gas reheating system. For the "Constant" unit the hot gas system is of series, the hot water system is not available.

11.4 – Humidification and dehumidification system

The humidification system needs the installation of the electronic humidifier HUMIDAIR.

The dehumidification function, currently supplied when the humidifier option is installed, is obtained by switching on the compressor and reducing the fan speed, with a consequent reduction of the air flow (in the models A and W) or completely opening the 3-way valve of the refrigerated water (in the models C).

Humidity electronic control

The software of the microprocessor control Hiromatic includes the algorithm which controls the electronic modulating humidifier HUMIDAIR and provides for the dehumidification function.

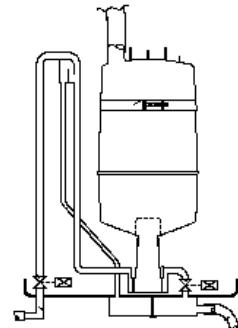

There is also a special function which automatically excludes the dehumidification function if the temperature decreases under the required values; when the temperature reaches the correct values, the dehumidification function is automatically restored.

The dehumidification control can be of the proportional or on-off type, depending on the requirements for any installation; the on-off system is set by the manufacturer as standard.

Electric steam humidifier HUMIDAIR

HUMIDAIR is a steam cylinder with immersed electrodes which enables the production of the necessary steam quantity.

It can use any sort of water (with different hardness), provided that it is not treated or demineralized. It produces almost instantaneously particle-free clean steam, making electric current pass through the water contained in the plastic cylinder that can be replaced, avoiding energy losses typical of other systems. HUMIDAIR is provided with the steam cylinder, water inlet and outlet valves, max. level sensor. The steam output can be adjusted within a range of values that can be selected manually and are set by the manufacturer at 70% of the max. power (see relevant features).

Features of the electronic humidifier

The steam cylinder is installed outside the air flow so as to avoid heat losses; the steam is mixed with the delivery air of the evaporating coil by the suitable distributor.

The Hiromatic control can determine when the cylinder must be replaced.

The replacement is quite simple and quick. A self-adaptive flow control system is installed as standard and controls the current passing through the cylinder water.

HUMIDAIR HAK53H is used for applications at 400 Volt, the model HAK53L, instead, is for 230 Volt.

HIFLEX MODEL	HUMIDAIR MODEL	MAIN POWER SUPPLIES	SETTING BAND [kg/h]	NOMINAL CURRENT [A]	NOMINAL POWER [kW]
4–5	HAK21L	230 V±1 ph/50–60 Hz	0.6–2.0	6.5	1.5
6–8–7–9	HAK53H	400 V±3 ph/50–60 Hz	1.3–4.5	5.0	3.4
6–8–7–9	HAK53L*	230 V±3 ph/50–60 Hz	1.2–4.2	8.2	3.1

* Special configuration on request.

11.5 – Water control valve (models W/H)

A modulating valve controls the condensation pressure by controlling the water flow to the plate condenser. It is installed at the condenser outlet with the pressure probe in the refrigerant drain line. It is automatically closed when the compressor is not working.

It provides for cost saving reducing water consumption. It is sized for inlet water flow temperature values lower than 17 °C (well water) ensuring a low value for pressure drop.

To define a proper water flow value depending on the specific operation features, refer to the performance tables of the units W.

For higher water inlet temperatures (tower water) there must be higher water flows; if the water control valve is required for these special conditions, see the section "Special water control valves" in the section of the "Special configurations".

Water control valve features

Models		4–5 W	6–7 W	8–9 W/H
outlet connections	inch BSP int.	1/2"	3/4"	3/4"
code		378201	378202	378202
valve pressure drop at 0.05 l/s	kPa	1		
valve pressure drop at 0.1 l/s	kPa	4	2	
valve pressure drop at 0.2 l/s	kPa	14	5	5
valve pressure drop at 0.3 l/s	kPa		12	12
valve pressure drop at 0.4 l/s	kPa			22

11.6 – Flooding alarm (Liquistat)

The flooding alarm perceives the presence of water or another conductive liquid and, by opening a circuit, it causes an alarm.

There are no moving parts and it is not subject to dirt or vibrations. Several sensors can be connected to the same flooding alarm device to control many points in the room. The alarm device is supplied with a sensor. Additional sensors can be ordered separately.

11.7 – Smoke alarm (Smokestat)

A smoke alarm can be installed to close the conditioning system when the presence of smoke in the return air is perceived.

This is an optic smoke detector (it uses the Tyndall effect), which absorbs a current with very low intensity (100 µA), totally insensitive to light or wind.

11.8 – Fire alarm (Firestat)

In some applications, the fire prevention norms require the installation of an alarm device (Firestat) that disables the conditioner if the return air temperature is particularly high.

This detector provided with an NTC thermistor has a very low current absorption (25–55 µA).

11.9 – Fresh air

The fresh air kit, with its own filter G3, installed on the fan suction side, has a connection with a plastic pipe with 100 mm diameter. The connection is placed in the lower part of the unit for an easier and quicker installation.

As it is positioned on the fan suction, the fresh air will easily mix with the recirculated air.

Models	Clean (dirty) filter fresh air ** (l/s)
4S/M/P U	28 (24)
4L/G U	29 (25)

* A 90° bend corresponds to approx. 2 m linear duct.

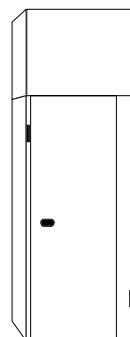

** Suction pipe diameter $\phi=100\text{mm}$

11.10 – Suction and delivery ducts

Hiflex can be provided with suction and delivery ducts on the top in order to be connected to a false ceiling. The air duct is made so as to keep the same appearance of the machine; the height (min. 600, max. 1200 mm) can be defined when the machine is ordered.

The duct is lined with deadening material to reduce the sound emission through the outlet air opening.

The maximum sound reduction, which can be obtained with 1200-mm-high ducts, is -5.5 dB(A) at 2 m in front of the machine (instrument positioned at 1.5 m from the floor) and -0.5 dB(A) at 1 m and at 45° with respect to the horizontal delivery plane of the machine, with free opening (not ducted).

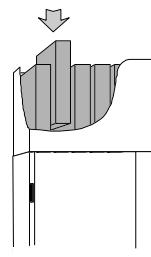

11.11 – Deadening cartridges for delivery channels – *Silent Carts* (models Over)

These are special cartridges made of self-extinguishing material with high deadening power. They are guaranteed against particle disaggregation and release as a result of the friction with the channel air. The pressure drop due to the introduction of these cartridges in the channel are low in comparison with the advantages resulting from the noise reduction.

One or two cartridge rows can be installed in the delivery channel: for channel heights between 600 mm and 1100 mm one single rank, whereas for channel heights between 1100 mm and 1200 mm one or two rows, by simply fitting them from the top.

With these cartridges, despite a small additional pressure drop, it is possible to obtain a considerable noise reduction as shown below.

The maximum achievable noise reduction is -8.5 dB(A) at 2 m on the front part (and at 1.5 m from the floor) and -13 dB(A) at 1 m and at 45° from the unit top with a cartridge rank in a 1200-mm-high channel. The reduction values refer to the comparison with the noise values that can be measured for each unit with free drain. In the same conditions, with a supplementary cartridge rank, respectively -9.5 dB(A) and -14 dB(A) can be obtained.

Cartridge features

Unit	dimensions	free section	cartridge number	
			1 rows	2 rows
4	500 x 195 x 500	400 x 100	2	4
6	500 x 195 x 500	400 x 100	3	6
8	500 x 195 x 500	400 x 100	3	6
5	500 x 195 x 500	400 x 100	4	8
7	500 x 195 x 500	400 x 100	6	12
9	500 x 195 x 500	400 x 100	6	12

Damping in dB(A)

n. rows	Damping in dB(A) at different frequencies (Hz)							
	63	125	250	500	1000	2000	4000	8000
1	1	4	7	15	26	28	27	14
2	1	6	12	27	49	53	49	23

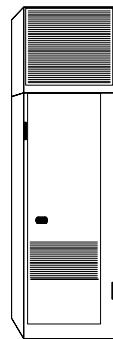

Pressure drop

n. rows	Pressure drop (Pa) for the different air flows (m³/s)		
	0.2	0.4	0.6
1	1	4	9
2	3	11	26

11.12 – Delivery plenum with horizontal throw (models Over)

A delivery plenum with horizontal air ejection can be installed on the unit top. The plenum is made of the same materials and colours of the unit panels; the height is 300mm for models 4, 600 mm for models 6–8. A grid with a deflection rank can be installed on the drain opening, 0.35 m².

The plenum is lined with deadening material to reduce the sound emission through the delivery opening.

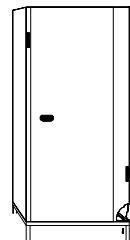

11.13 – Grid with one deflection rank (models Over)

A metal grid provided with adjustable deflection fins on one single rank to be installed on the unit top or on the plenum inlet can be supplied separately on request. In this way, the delivery air flow can be deflected toward the front or the rear part of the unit. Do not deflect the fins too much, as this may cause an excessive clogging of the air passage section with consequent unacceptable reduction of the unit refrigerating output.

11.14 – Base–frames: models TBD

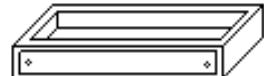

When required, a base–frame that can be adjusted in height by +/– 25 mm can be supplied starting from 200 mm to support Hiflex machines (see enclosed drawings).

Model	Length [mm]	Depth [mm]	Height [mm]
4	740	445	> 300 > 500 > 800
6	740	595	
8	740	745	
5	1470	445	
7	1470	595	
9	1470	745	

11.15 – Base–modules (models Over)

A suitable 200 mm (300 mm with high efficiency filters and 500 mm with suction from rear) –high base–module can be supplied on request to support the Hiflex Over units; it is open on the rear side to allow return air from the bottom even if there is no raised floor (the unit must be provided with a blind front panel – see return air from the bottom in the section Special features).

11.16 – Automatic condensate drain pump

Hiflex drain piping can be connected to a pump complete with a flow switch for automatic start and stop.

Features of the automatic condensate drain pump

water flow	[l/s]	0.083	0.167	0.250	0.333
available head	[kPa]	20	19	18	14
dimensions	[mm]	95	95	95	95

11.17 – Non-return valve (models A and D)

For air-condensed units, a non-return valve is supplied on request in a separate kit. It should be installed on the liquid line near the condenser, vertically with downward flow. The installation of this valve is absolutely necessary when the total charge of the system exceeds the values given in the table:

Model	Maximum refrigerant charge without non-return valve [kg]
4S/P/M	4.5
4L/G	2
6S/P	2
6L/G	4.5
8S/P	4.5
8L/G	4.5
5S/P/M	4.5 x 2
5L/G	2 x 2
7S/P	2 x 2
7L/G	4.5 x 2
9S/P	4.5 x 2
9L/G	4.5 x 2

11.18 – Additional temperature and humidity sensor (EEAP)

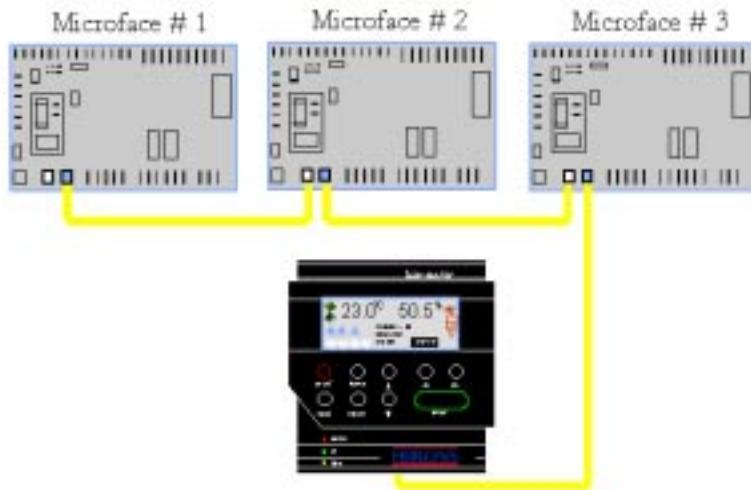

"EEAP" is an additional temperature and relative humidity sensor similar to the humitemp sensor. EEAP means "Electronic Environmental Alarm Package".

The sensor can be installed in a representative place up to 20 m from the conditioner and emits an alarm if the temperature or the relative humidity exceeds one of the four thresholds that can be selected by the user:

- | | |
|------------------------|-----------------------|
| high temperature | (from 10 °C to 50 °C) |
| low temperature | (from 0 °C to 30 °C) |
| high relative humidity | (from 30% to 99%) |
| low relative humidity | (from 10% to 70%). |

11.19 – Microprocessor control with graphic display HIROMATIC G

The Hiromatic graphic display terminal is particularly suitable for group management. Indeed, thanks to the generous dimensions of the display and to its exceptional contrast, it allows the user to move around freely within the Microface network. Therefore, from a single point, it is possible to control the whole system without moving from one unit to another. The last 200 events occurring in the system; the graphic development of the last 24 hours for each of the units connected (stored since the last start-up), the user's menus available in 8 languages and connectivity through RS 422 to the Hirolink Communication Manager are just some of the features available with Hiromatic. Moreover, as Hiromatic can be supplied in kit form, it may be installed either on the unit or on a remote panel for primary supervision of the system.

Hiromatic controls the date and time functions using them as operating information for the customer and as a reference whenever a status change occurs, causing the storage in the Report status. In addition, details of the event which occurred and the date and time at which the event occurred are stored as well. Thanks to the buffered RAM it is possible to store the operating hours of each component (compressor, fan, electric heaters, humidifier) of the various interconnected units.

In addition to the date-time function, there is a function for stand-by unit rotation which can be activated *only by means of Hiromatic* at a preset time of day. This is different from the Microface function, in which the rotation occurs when 24 operating hours of one unit have been reached.

Finally, Hiromatic allows the Microface units to be integrated with Hirolink; for this purpose it is necessary to install a RS422 card at the back of Hiromatic. In this way, Hiromatic can control up to 8 Microface units and communicate the relevant data to Hirolink.

Serial communication

Integration

Hirolink is the key to the integration; it works as 'communication manager' between the Hiromatic-Microface units and all the foremost supervision systems available on the market. It also provides the link with Hirovisor supervision system, which is the ideal solution for all integration requirements within the intelligent building. This permits local access to the units or, as an alternative, modem connection to supervise several installations from a single remote point.

The components necessary for integration are shown in the picture above. The only 'variations' are the software installed on Hirolink and the relevant hardware configuration which determines a different code.

11.20 – Deadening insulation coating

On request, a fiber glass insulation may be provided as heat and sound protection: a protective film and a special gasket on the closing prevent particle dispersion and help the proper mechanical resistance of the insulation. Some plastic gaskets fit on the panel hinder the air by-pass. The material is fully nonflammable and meets the requirements of the American norms NFPA90A and 90B concerning fire and smoke prevention.

11.21 – Duct with deadening insulation coating

A special duct with nonflammable deadening insulation coating in compliance with the fire and smoke prevention norms NFPA and 90B can be supplied on request.

11.22 – Power supply at 230/3/50

On request, all machines can be adapted for the power supply at 230/3/50.

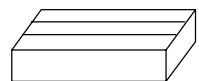

The refrigerating powers of the version at 230/3/50 are the same as the standard version at 400/3/50.
The electric configurations are shown in the section "Summary of the electrical features".

11.23 – Special packing

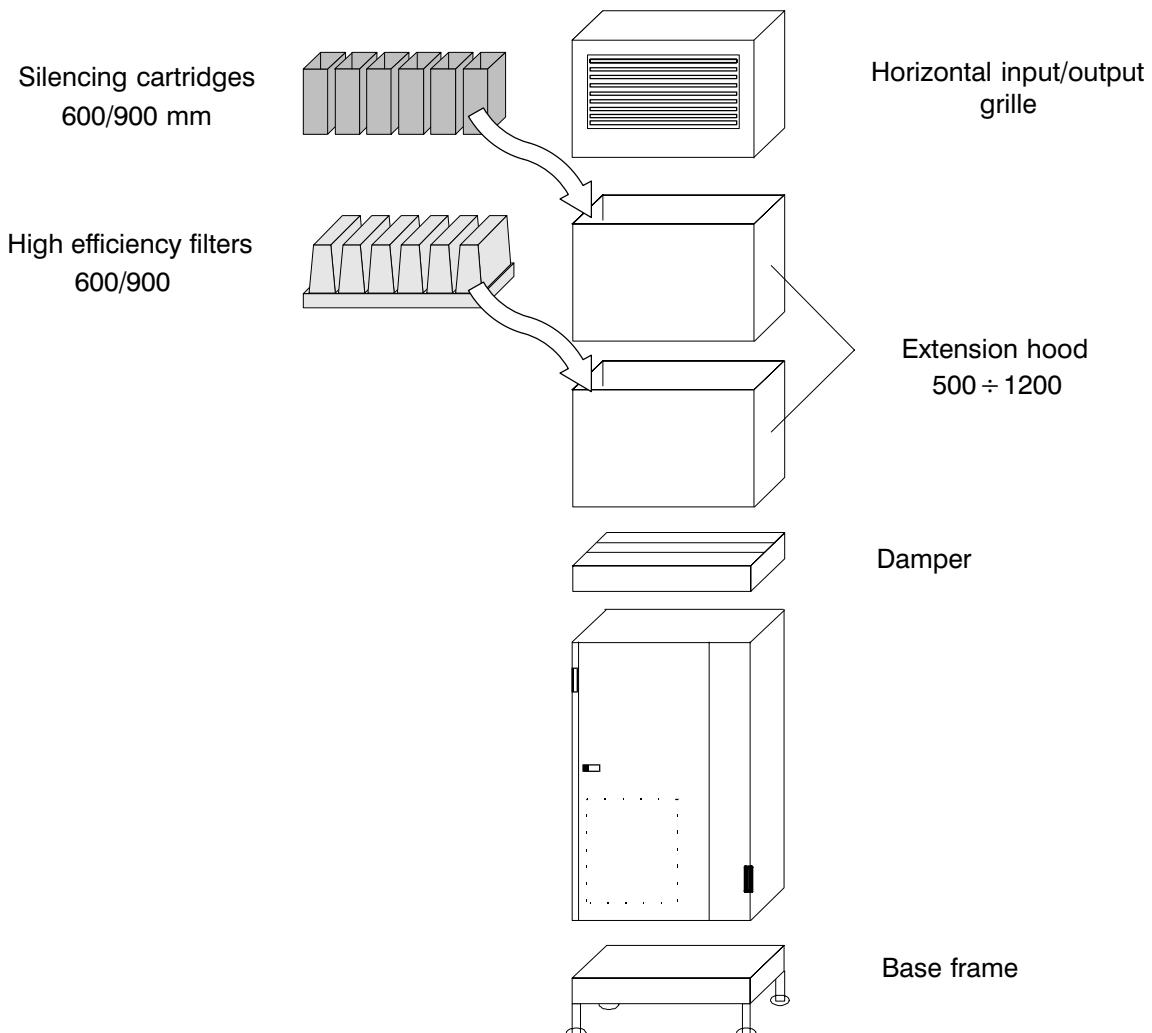

A special packing for sea transport consisting of a wooden box or crate in addition to normal cardboard can be supplied on request.

11.24 – Air intake from the bottom (models Over)

Hiflex units can be supplied to enable the air intake. In this case, the front panel with intake grille is replaced by a special blind panel, which allows the sound emission to be further limited.

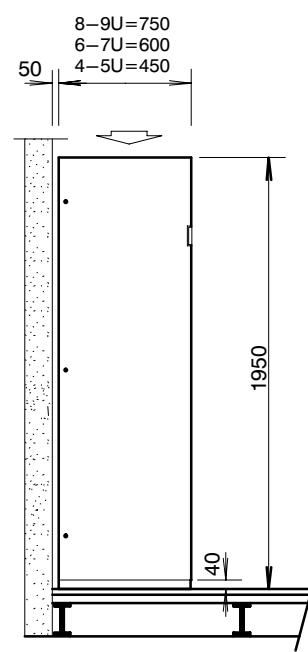

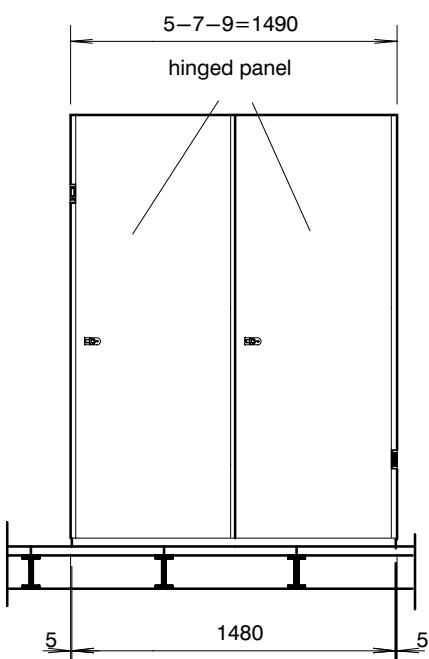

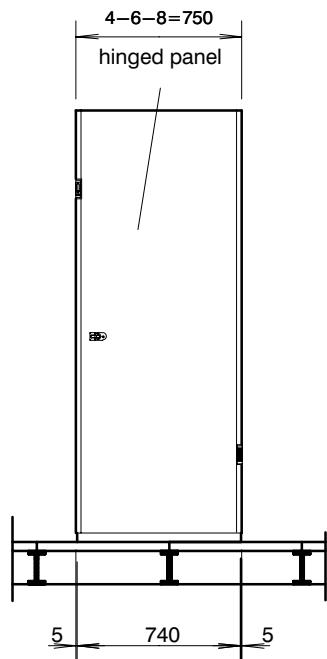

11.25 – Accessory combination

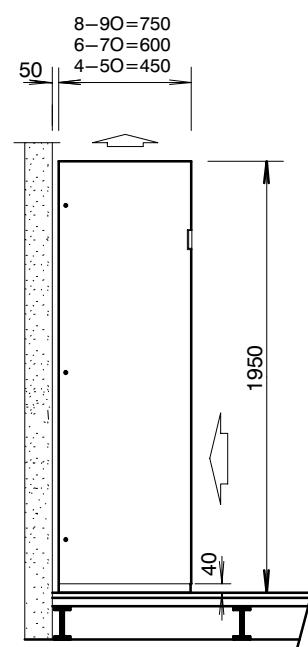

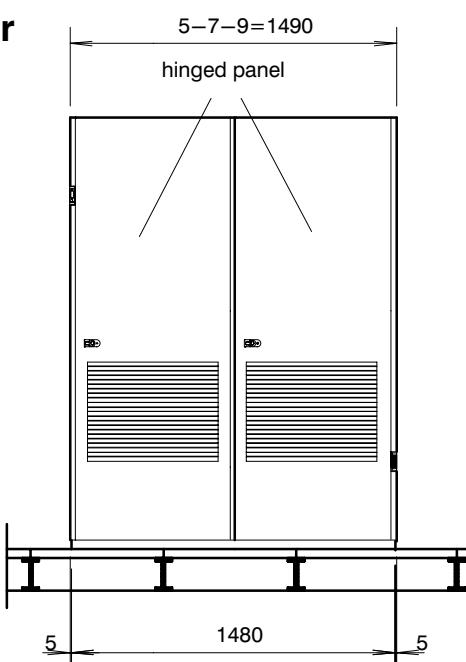

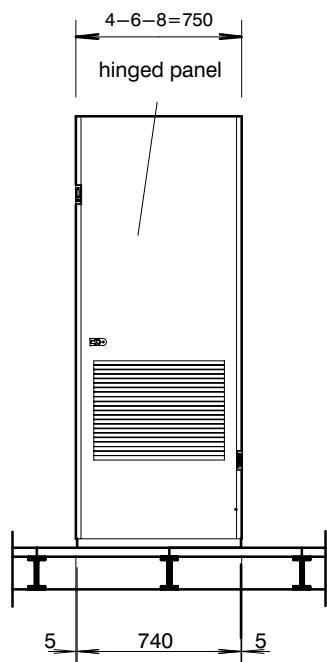

12 – Overall dimensions
